

digger crayfish

Creaserinus fodiens

FEATURES

The digger crayfish has large claws. Its back is often olive-brown with dark brown blotches but may be light brown or rust-red.

BEHAVIORS

The digger crayfish lives on wooded floodplains and in places where there were once wooded floodplains. *Creaserinus fodiens* is a burrowing species and is found in surface waters only during floods. The burrows are frequently marked with mudball chimneys and may have up to three entrances. Burrows may be several feet deep. Females with eggs (average number about 130) have been found in early spring. Eggs hatch a few weeks later. This species is an omnivore, eating both plant and animal materials.

TAXONOMY

Kingdom: Animalia
Phylum: Arthropoda
Class: Malacostraca
Order: Decapoda
Family: Cambaridae

ILLINOIS STATUS

common, native
