

dwarf larkspur

Delphinium tricorne

FEATURES

The dwarf larkspur is also called wild larkspur or spring larkspur. This perennial plant grows from roots. It may attain a height of two and one-half feet. The leaves alternate along the stem. Each leaf is divided into five to seven lobes. Several flowers are clustered on a stalk at the tip of the stem. Each blue, four-petaled flower may be one and one-half inches long. Five sepals are also present, one of which is developed into a spur.

BEHAVIORS

The dwarf larkspur may be found in the southern two-thirds of Illinois. It grows in rich woods. Flowers are present from April through June.
