

GRANT AGREEMENT #09-020W

GRANTEE: Jack Shouba, 39W684 Caribou Trail, St. Charles, IL 60175
630-443-6126 jackshouba@gmail.com

TIME FRAME: 21 August 2008 to 30 June 2009

REPORT COMPLETED BY: Jack Shouba and Ken Johnson

PROJECT OBJECTIVE: To prepare an updated species list and FQA and recommendations for restoration and management.

COMPLETED PROJECT DESCRIPTION:

TROUT VALLEY FEN FLORISTIC QUALITY ASSESSMENT

INTRODUCTION

A fen or seep is a rare and unique natural wetland community which is dependent on subsurface, alkaline water flow rather than surface runoff such as is found in bogs, marshes and other wetlands. Fens are very sensitive to changes in water quantity or quantity.

Trout Valley Fen is an approximately 9.8-acre natural area located in the Village of Trout Valley in McHenry County and owned as common property by the Trout Valley Homeowners Association (HOA). Valued for its scenic beauty and natural character, the fen provides a steady supply of clean, cold water to the (artificial) trout ponds that give the village its name. Unfortunately, the fen is being impacted by erosion, sedimentation, invasion by non-native species and inadequate management, but the Village and the HOA are working to address these issues. A Floristic Quality Assessment (FQA) is an important first step to understand existing habitat character and quality.

The basic idea of an FQA is to assess the current condition of an area by recording all of the plants currently present, along with other information. In general terms, a high quality natural area is characterized by a large number of native species, a small number of non-native (also known as adventive or alien) species, and the presence of what are known as "conservative" plants; that is, native plants that are most likely found in undisturbed natural areas. The most conservative plants are highly indicative of high quality natural areas. On the other hand, a disturbed area will have few natives, many non-native weeds, and few if any conservative plants.

HOW IS A PLANT LIST AND FQA HELPFUL TO TROUT VALLEY FEN?

1. The FQA helps document the high quality of the area. This can be helpful in obtaining grants as well as in providing recognition and long-term legal protection for the land.

2. The plant list and FQA score can be used to educate neighbors and Village officials as to the irreplaceable natural resource under their care.
3. The plant list can be used to help guide restoration. Non-native and aggressive native plants should be removed or controlled, while conservative plants should be encouraged.
4. A future FQA with floristic values that trend up would indicate management activities are effective. On the other hand, if the FQA values go down or conservative plants disappear, management activities should be reevaluated.
5. The plants on the list can be checked in *Plants of the Chicago Region* (4th ed.) by Swink and Wilhelm to see what other plants typically grow with them and if the species is known from McHenry County. The plants, particularly the conservative ones, should be documented by photography or collection by a botanist.

RESULTS AND RECOMMENDATIONS

1. The Plant Inventory and Floristic Quality Assessment is included with this report as Table 1. We are also including a brief explanation of how to interpret the data, titled "Floristic Quality Assessment Data". Note that the number of native plants is quite high (135), as is the mean C (conservatism) value (4.6). Together, these result in a very high FQI (Floristic Quality Index) of 53, indicating that this is a significant natural area from a regional perspective.
2. The area is on the McHenry County Natural Areas Inventory.
3. We recommend that the fen be nominated for the Illinois Natural Areas Inventory. Included as Table 3 is an undated inventory and FQA possibly done in 1994. This plant list may have been prepared by Brad Semel and Wayne Schennum, and may have been an effort by the state to include this property on the inventory. The state is now updating the inventory so we believe the area should be reconsidered. If it qualifies, dedication as an Illinois Nature Preserve should be considered; this would offer the highest level of protection available in the state.
4. A third plant list is included as Table 2. The list was provided to us by the HOA, and represents a plant inventory and FQA completed as part of a wetland delineation of the fen.
5. Table 4 lists 36 native species from the other two plant lists that we did not see in our efforts. There are several possible explanations for this. We may have missed the spot where the plant grows, the plant might have been visible had we visited on a different date, the plant might have been misidentified, or it might have been present previously and is no longer there. This list could serve as a "watch list" to keep looking for these plants.
6. In terms of habitat management, the fen is suffering from erosion, runoff, and siltation. We understand the Village and the HOA are taking steps to alleviate these problems. In addition, native plants are being displaced by non-natives and even some aggressive natives. Trees are increasing in size and shading out plants in many areas. While some non-native plants are not causing problems and may

only be found along trails and the edges of the fen, a number of plants should be on the priority list for removal. These include the native Box-elder and Eastern Cottonwood, as well as the non-native Norway Maple, Japanese Barberry, Winged Euonymus, European Fly Honeysuckle, Multiflora Rose, and European Highbush Cranberry. We have met with some of the neighbors and they seem eager to begin land management activities.

7. We are including a 1939 aerial photo of the site. Other historic aerial photos can be obtained from the McHenry County Soil and Water Conservation District. These photos are sometimes helpful in reconstructing past conditions, such as how much area the tree canopy covered. The District can also furnish information on the soils.

8. We are including a contour map, showing the steep slopes around the edges of the wetland. Woodland and prairie plants grow on these slopes, increasing the diversity of the area and protecting the wetland from runoff. These upland areas are an integral part of the system and should be protected and restored. The ground flora in some areas is depauperate due to shading out by maples and other trees in recent years. Some of the uplands are part of private lots, so it is important to work with the individual homeowners in order to protect the area.

9. We suspect that some rare plants may have been introduced, since they are not otherwise known as indigenous to McHenry County or are not found in this habitat. Foamflower (*Tiarella cordifolia*) and Celandine Poppy (*Stylophorum diphyllum*) would be in this category (Celandine Poppy is commonly planted). Trees like Redbud, Tamarack and the shrub Ninebark are also commonly planted. This possibility must be considered, especially since the property was once part of the Hertz estate and was landscaped by Jens Jensen. If old landscape records could be found, they might shed light on this mystery.

SUMMARY

The Trout Valley Fen is a beautiful, high quality natural area that has suffered some disturbances over the years, yet still shows up very high on a Floristic Quality Assessment. We commend Trout Valley for their interest in preserving this landscape by addressing runoff and siltation issues, and removing invasive plants. We recommend additional efforts to document the history of the area. We also recommend seeking the assistance of the McHenry County Conservation District, the McHenry County Soil and Water Conservation District, the Illinois Department of Natural Resources and the Illinois Nature Preserves Commission. We also recommend continuing to monitor the plants, perhaps repeating the FQA every few years.

FLORISTIC QUALITY ASSESSMENT DATA

The following is a summary of the plant inventory data generated using Wilhelm and Masters' *Floristic Quality Assessment and Computer Applications*, 1999. Plant nomenclature follows Swink and Wilhelm's *Plants of the Chicago Region*, 1994. More information on floristic quality assessment methodology can be found in *Erienia*, number 15, November, 1997. The results of each inventory are presented in two sections as described below.

Section 1 includes three tables that summarize the inventory assessment data. The table to the left is an analysis of the floristic quality of the project area. In addition to listing the number of native species and total number of species, the mean coefficient of conservatism (MEAN C), floristic quality index (FQI), and mean wetness (MEAN W) values are presented. These are calculated once for native species only, and a second time including adventive species (W/Adventives). The two other tables summarize the number and percent of species in each physiognomic group (A=annual, B=biennial, P=perennial, W=woody, H=herbaceous).

Section 2 includes the plant inventory arranged alphabetically, with each species preceded by its database acronym and coefficient of conservatism (C=0 to 10, weedy to conservative); and followed by its wetness coefficient (W=-5 to +5, wet to dry), corresponding national wetland indicator status (OBL=obligate wetland species, FAC=facultative species, UPL=upland species), physiognomic group, and common name. Adventive species are written in ALL CAPS and have an asterisk (*) for their C value.

The Mean C is the average coefficient of conservatism for the site. The FQI is derived by multiplying Mean C by the square root of the number of species present. In general, sites with FQI values less than twenty are degraded or derelict plant communities, or are very small habitat remnants. Sites with FQI values in the twenties through low thirties suffer from various kinds of disturbance, but generally have potential for habitat restoration and recovery. When sites have FQI values in the middle thirties or higher, one can be confident that there is sufficient native character present for the area to be at least regionally noteworthy. Sites with indices in the middle forties and higher are often also statewide significant natural areas.

TABLE 4

Site: Trout Valley Fen
 Locale: Trout Valley, IL
 Date: July 2009
 By: Jack Shouba & Ken Johnson

Note: These 36 species represent native taxa not observed during our 3 site visits in 2008 and 2009, yet recorded from the Trout Valley Fen area in other inventories. Those species with C values greater than 5 represent conservative species (especially those with values of 9 and 10).
