

The purpose for scoring North American big game is deeply rooted in history and biology.

More than Bragging Rights

Whether it came after months in the tree stand, learning the habits of one particular whitetail, or just being in the right place at the right time, the sportsman does earn bragging rights for bagging a trophy deer.

But it almost wasn't so.

By the late 1800s, unchecked habitat destruction and harvest of North American big game drew the attention of a number of influential men—legislators, magazine editors, military officers, lawmen, artists, sculptors and scientists—who shared a passion for hunting and the outdoors, and feared for the future of species such as bison, deer, elk, sheep and pronghorn.

On December 12, 1887, 12 gentlemen—including Theodore Roosevelt—founded the Boone and Crockett Club, what is now the oldest conservation

organization in North America. In 1902, Roosevelt was one of three individuals appointed to a special committee charged with devising a scoring system to record and preserve biological information of native North American big game animals believed to be going extinct. It wasn't until 1950 that the club's current, copyrighted scoring system was formally adopted.

"The purpose of setting up a scoring system wasn't to give sportsmen a system for earning bragging rights," explained Jack Reneau, the Boone and Crockett Club director of big game records. "Through the information collected by measuring antlers, horns and skulls, a record was amassed of biological, harvest and location data."

The club continues its tradition of promoting fair chase and the sport of hunting, and to invest in the future through a variety of education projects.

Story By Kathy Andrews
and Tracy Shafer

One of the measurements official scorers for the Boone and Crockett Club take is the circumference at the smallest place between the burr (point of attachment to the skull) and the first point. A flexible, steel tape is used for all measurements.

In addition to measuring the length of the main beam (pictured), scorers measure the circumference between each of the antler points and the length of the points. A point is a projection that is at least 1 inch long and longer than it is wide.

In the late 1980s, the club purchased the Theodore Roosevelt Memorial Ranch in Montana and established an education center there in 2001. Kindergarten through high school students and teachers of all ages visit the center to learn about the importance of sustaining healthy ecosystems. Additionally, a grants-in-aid program helps underwrite critical wildlife management research by graduate students.

Through the scoring process and research projects, biologists have a record of the successes of conservation

and how wildlife management activities are working.

“Each year,” Reneau concluded, “more than 1,500 Boone and Crockett entries are received—evidence of the need for the wildlife management principles envisioned more than 120 years ago.”

The Boone and Crockett Club was named for famed explorers and hunters Daniel Boone and Davy Crockett.

Training to become an official Boone and Crockett scorer requires 3.5 days of hands-on practice learning to score the 38 categories of native North American big game recognized by the club.

Think you have a trophy? Contact the Boone and Crockett Club at (406) 542-1888 or visit www.booneandcrocketclub.com to obtain an official scoring sheet. If after completing your initial score the animal appears to qualify, the club will provide contact information for the closest official measurer.

The following records are for deer submitted during 2004.

Firearm Typical

John Sondag	185 0/8	2004	Mason
J.C. Linson	180 4/8	2004	Wabash
