Subsection (d)(1) of Section 245.850 provides for testing radioactivity only one time— during the early flowback stage—and only for "naturally occurring radioactive materials". The problems with this are identified below. Problems: The proposed rules do not include any standards or protocols to follow if testing of flowback water shows unacceptable levels of radioactivity. The proposed rules do not require the testing of "produced water", which is the water produced from a well in conjunction with oil or natural gas production. This is where radioactivity is most likely to show up. It should be noted that while these Rules have been purported to be the strongest in the nation, PA law requires the testing of produced water at two separate intervals. The proposed rules do not require testing for added radioactive materials, like depleted uranium, which can be used in the perforation/fracturing operation. The proposed rules do not test work areas for levels of radioactivity that would call for OSHA standards of occupational safety. Rules §245.850(d)1-E and §245.850(e) are incomplete and deficient, and these inadequacies can "constitute a serious threat"--indeed, deadly threat-- "to the public interest, safety, or welfare" of Illinois citizens" and are in violation of section 1-75(a)(2) of the Hydraulic Fracturing Regulatory Act.

Sincerely, Westin Campo chicago, IL 60608

In reference to Subpart H: High Volume Horizontal Hydraulic Fracturing Preparations and Operations

Section 245.850 Hydraulic Fracturing Fluid & HF Flowback Storage, Disposal or Recycling, Trans & Reporting Req.

To the Illinois Department of Natural Resources, In this comment I am addressing just one loophole that is found in your insufficiently put together rules and regulations drafted for hydraulic fracturing here in Illinois. The loophole I am referring to in this comment is with regards to open air pits onsite. Within the proposed rules, Section 1-75 instructs that “excess hydraulic fracturing flowback captured for temporary storage in a reserve pit as provided in paragraph (2) of this subsection must be removed from the well site within 7 days.” But then, however, Section 245.850 of the proposed rules states, “Any excess hydraulic fracturing flowback captured for temporary storage in a reserve pit as provided in Section 245.825 must be removed from the well site or transferred to storage in above-ground tanks for later disposal or recycling within 7 days after completion of high volume horizontal hydraulic fracturing operations.” I don’t know about you, but these seems like a huge loophole to me! In the end, the amendment of “after completion of high volume horizontal hydraulic fracturing operations” opens the door for the potential abuse of emergency pits. These companies can merely miscalculate the amount of flowback continually and, thus, repeatedly store flowback/wastewater in open air pits onsite for up to seven days. This is a viable action for operators wanting to cut costs considering storage in closed tanks (versus open air pits) can be quite costly for the industry. Section 245.210(a)(11), requires that an applicant submit a Hydraulic Fracturing Fluids and Flowback Plan. The plan does not include requirements to ensure that tank capacity is accurately calculated. Without such method, there is nothing in the regulations to prevent operators from underestimating the size of the tanks they need, so as to make routine use of the reserve pit for the resulting overflows. Operators presumably have an economic incentive to do so in order to hold down the cost of tank storage. The regulations also fail to require prompt removal of the fracking flowback stored in these open air pits. In Subsection 245.850(c) it is stated that the overflow can remain in these reserve pits until 7 days “after completion of high volume horizontal hydraulic fracturing operations.” In some instances, hydraulic fracturing operations can continue on for more than a month which means that this flowback fluid can be left sitting in this ‘reserve pit’ for exactly that long. This truly creates a higher possibility of risk for the environment! Leaving it in there that long is increasing the chance that something will happen as a result whether that be runoff from the pit into nearby surface water as a result of heavy rainfall/ flood(s), or tearing of the pit liner resulting in the fracking fluids leaking into the ground and potentially into people’s groundwater drinking supply I understand that this rule is geared towards emergencies only, and that these fracking companies must otherwise store the flowback water in storage tanks onsite. However, even you must be able to see that you have created a huge loophole for fracking companies looking to cut costs. That loophole is very apparent, even to me. With your level of education, plus the fact that you have helped draft these rules and regulations, this loophole surely must be shouting out at you. In order to help improve these drafted rules and regulations, I demand that you improve what I have just discussed. One way to go above making this one improvement would be to: First, require that drillers anticipate

## Fair Economy Illinois

---

appropriate sized tanks for sufficient storage of flowback and produced water by establishing a method for tank capacity calculation. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law Thank you for your time in reading this, and I hope that you can omit this loophole that threatens the environment and only adds to fracking corporations' profits.

Sincerely, Rebecca Quesnell 3 Talisman Trace Galena, IL 61036

We need more public hearings. I cannot believe you have scheduled the hearings so close to Christmas. You are not being fair to those of us who want our voices to be heard. We need more hearings. Do you intend to schedule hearings again after you've redone the rules and they are submitted to the public again?

Sincerely, Annette McMichael 1174 Karen Dr. Monticello, IL 61856

In reference to Subpart H: High Volume Horizontal Hydraulic Fracturing Preparations and Operations

Section 245.850 Hydraulic Fracturing Fluid & HF Flowback Storage, Disposal or Recycling, Trans & Reporting Req.

Working in mining and energy jobs can be very dangerous and I respect the people who put a lot of sweat into their work. However, just because a job is hard work does not mean that it should be dangerous, especially when such dangers can be prevented if companies were not so stingy and willing to put more money into testing the radioactivity and also because the fines for putting lives at risk is a measly 2000 dollars, less than fines for violations that regular citizens make, that DO NOT put lives into danger. It really bothers me that there are such poor testing standards for radioactivity in water that affect THE VERY PEOPLE WORKING FOR THE COMPANIES. Don't you want your workers to not get sick and possible die? Isn't this common human decency? Comment/Problem(s)/Needed Revisions: Subsection (d)(1) of Section 245.850 provides for testing of fracking fluids only one time--during the early flowback stage--and only for "naturally occurring radioactive materials." Notably absent from these proposed rules is a requirement for the testing of "produced water", the fluid that returns from the well during the later stage of production (after flowback). Under the proposed rules, "produced water" can be stored on site and/or can be "recycled", yet there is no testing requirement. Naturally occurring radioactive material (NORM) is found in "produced water" also. See Technologically enhanced naturally occurring radioactive materials in the oil industry (TENORM), Nukleonika 2009; 54(1):3-9, and sources cited therein, especially for TENORM in produced water in the U.S., available at [http://www.nukleonika.pl/www/back/full/vol54\\_2009/v54n1p003f.pdf](http://www.nukleonika.pl/www/back/full/vol54_2009/v54n1p003f.pdf). See also NORM is also found on scale in oil pipes and on fracking equipment. (See Kentucky Resources Council Proposes Comprehensive Plan For Investigating Radiological Contamination In Martha Oil Field. August 11, 2005. <http://www.kyrc.org/webnewspro/112381723236086.shtml>.) IDNR's definitions of "flowback water" and "produced water" are different. The two are distinguishably different enough that they are treated as separate types of fluid by both the Hydraulic Fracturing Regulatory Act and by the DNR Rules. Discharge of produced water onto the ground or into surface water or water drainage way is prohibited but it is not tested for radioactivity. This despite the fact that this fluid will be in contact with the naturally occurring radioactive elements in the ground for a longer period than the flowback and that it is much more likely to be radioactive. Problems: Failure to test produced water for radioactivity is problematic for a variety of reasons including: The health and safety of workers on the site who will be unaware of the levels of radioactivity they are being exposed to. The health and safety of workers transporting produced water who will also be in the dark regarding the levels of radioactivity they will be exposed to. The risk of storing radioactive material in tanks not created for storing radioactive materials. The risk of "recycling" produced water—radioactivity cannot be removed by recycling. The risk to the public in transporting radioactive materials Argonne National Laboratory recently cautioned about radiological doses: "It is commonly accepted that efforts should be undertaken at all times to keep radiological doses 'as low as reasonably achievable,' which is referred to as the ALARA principle or requirement." Overview of Radiological Dose and Risk Assessment (April 2011). DNR is failing to even

## Fair Economy Illinois

adequately test for radioactivity and therefore, will not know the levels of radioactivity. How, then, can DNR adequately protect workers and the general public? Revisions needed: At a bare minimum, the rules should require that “produced water” be tested at two separate intervals across time for radioactivity. This is already required in Pennsylvania. The rules should also require that the requirements of the Illinois Low Level Radioactivity Waste Management Act be followed.

Sincerely, Harry Li 2656 Boddington Lane Naperville, IL 60564

Section 245.850 Hydraulic Fracturing Fluid & HF Flowback Storage, Disposal or Recycling, Trans & Reporting Req.

Your insufficient and unjust regulations for fracking are difficult to comprehend. With so many alternatives available, there stands no reason as to why the use of fracking should be allowed or even considered within the United States. The number of side effects outweigh any possible benefits besides capital gain for some corporate asshole. IDNR should be ashamed and saddened by allowing these regulations to be passed through their system. I for one feel we need to adopt an energy plan comparable to Germany; proposing to become more self-sufficient every decade with an estimated %50 of energy coming from renewable sources by 2050. IDNR and other lobbyists should think twice of their decisions and its' affects upon the wonderful people of this state. I hope the bonus you received for signing these regulations adds up to a life full of false happiness and depression.

Sincerely, Henry Brennan Allsworth Chicago, IL 60651

In reference to Subpart H: High Volume Horizontal Hydraulic Fracturing Preparations and Operations

Section 245.850 Hydraulic Fracturing Fluid & HF Flowback Storage, Disposal or Recycling, Trans & Reporting Req.

Section 1-75 of the Hydraulic Fracturing Regulator Act mandates that “excess hydraulic fracturing flowback captured for temporary storage in a reserve pit as provided in paragraph (2) of this subsection must be removed from the well site within 7 days.” But Section 245.850 of the proposed rules states, “Any excess hydraulic fracturing flowback captured for temporary storage in a reserve pit as provided in Section 245.825 must be removed from the well site or transferred to storage in above-ground tanks for later disposal or recycling within 7 days after completion of high volume horizontal hydraulic fracturing operations.” Problem: The amendment of “after completion of high volume horizontal hydraulic fracturing operations” opens the door for the potential abuse of emergency pits. Storage in closed tanks can be costly for the industry. An unscrupulous operator wanting to cut costs could simply claim that there was more flowback than expected and end up using open pits for storage for the duration of the fracking process. The clear intent of the statute is to ensure that wastewater is stored in tanks except in the emergency event of an unforeseeable overflow, in which case it is preferable that the overflow go to a pit than simply spill on the ground. But in such event, the overflow is expressly required in the statute to be removed within a week. Through omission and misinterpretation, the regulations are not implementing this statutory directive. Section 245.210(a)(11), requires that an applicant submit a Hydraulic Fracturing Fluids and Flowback Plan. The plan does not include requirements to ensure that tank capacity is accurately calculated. Without such method, there is nothing in the regulations to prevent operators from underestimating the size of the tanks they need, so as to make routine use of the reserve pit for the resulting overflows. Operators presumably have an economic incentive to do so in order to hold down the cost of tank storage. Compounding this incentive is the Department’s weakening of the statutory directive that fluids deposited in a reserve pit be removed within 7 days (Section 1-75(c)(5)). The regulations fail to require such prompt removal, allowing, at subsection 245.850(c), the overflow to remain in the reserve pits until 7 days “after completion of high volume horizontal hydraulic fracturing operations.” Certainly on a multi-well pad, hydraulic fracturing operations can continue for a month or more, meaning that the flowback fluid could be left sitting in the reserve pit, creating environmental risk, for much longer than a week. Revisions needed: First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water by establishing a method for tank capacity calculation. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law.

Sincerely, B. E. Murphy 458 Tahoe Park Forest, IL 60466

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production According to wikipedia: Hydraulic fracturing is the fracturing of rock by a pressurized liquid. Some hydraulic fractures form naturally—certain veins or dikes are examples. Induced hydraulic fracturing or hydrofracturing, commonly known as fracking, is a technique in which typically water is mixed with sand and chemicals, and the mixture is injected at high pressure into a wellbore to create small fractures (typically less than 1mm), along which fluids such as gas, petroleum, uranium-bearing solution,[1] and brine water may migrate to the well. Hydraulic pressure is removed from the well, then small grains of proppant (sand or aluminium oxide) hold these fractures open once the rock achieves equilibrium. The technique is very common in wells for shale gas, tight gas, tight oil, and coal seam gas[2][3] and hard rock wells. This well stimulation is usually conducted once in the life of the well and greatly enhances fluid removal and well productivity, but there has been an increasing trend towards multiple hydraulic fracturing as production declines. A different technique where only acid is injected is referred to as acidizing. The first experimental use of hydraulic fracturing was in 1947, and the first commercially successful applications were in 1949. George P. Mitchell is considered by some the modern father of fracking when he successfully applied it to the Barnett Shale in the 1990s.[4] As of 2010, it was estimated that 60% of all new oil and gas wells worldwide were being hydraulically fractured.[5] As of 2012, 2.5 million hydraulic fracturing jobs have been performed on oil and gas wells worldwide, more than one million of them in the United States.[6][7] Uranium Energy Corporation is planning to use hydraulic fracturing to mine uranium. Fracking for uranium involves injecting oxygenated water (to increase solubility) to dissolve the uranium, then pumping the solution back up to the surface.[1] Halliburton Frack Job in the Bakken Formation, North Dakota, United States Proponents of hydraulic fracturing point to the economic benefits from the vast amounts of formerly inaccessible hydrocarbons the process can extract.[8] Opponents point to potential environmental impacts, including contamination of ground water, depletion of fresh water, risks to air quality, noise pollution, the migration of gases and hydraulic fracturing chemicals to the surface, surface contamination from spills and flow-back, and the health effects of these.[9] For these reasons hydraulic fracturing has come under international scrutiny, with some countries suspending or banning it.[10][11] However, some of those countries, including most notably the United Kingdom,[12] have recently lifted their bans, choosing to focus on regulations instead of outright prohibition. The 2013 draft EU-Canada trade treaty includes language outlawing any breach of legitimate expectations of investors which may occur if revoking drilling licences of Canadaregistered companies in the territory of the European Union after the treaty comes into force.[13] Under Chapter 11 of the existing North American Free Trade Agreement, private companies can sue governments when new laws reduce expected profits from existing contracts.[14]. And therefore, I disagree with this coming to Illinois.

Sincerely, David Klawitter 718 W. Rochford Street (D910) Chicago, IL 60607

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Dear IDNR, Section 1-53 of the regulatory bill states that fracking can be operated in a manner that will protect the public health and safety and prevent pollution.” THIS IS NOT POSSIBLE. Fracking is inherently a harmful process and laying these weak guidelines will not stop it from being so. The only way for fracking to be operated in a way that does not harm the public and the environment is to not frack at all. Volatile Organic Compound (VOC) Emissions which are a direct result of fracking no matter what method is used are harmful to the people of this earth and the earth itself. VOC emissions can cause irreversible neurological and respiratory damage to children, adults, and other living creatures. Do not poison us, VOCs have caused problems such as asthma and cancer, such is the case in Colorado where numbers of these diseases have spikes since fracking began there. The current rules concerning VOCs in the Illinois legislation are nonexistent. This is a careless and thoughtless problem that must be addressed. Actually the Rules and regulations right now do the exact opposite of protecting us from VOCs, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn't “cost effective” or if it is “economically unreasonable.” How is this okay? How can YOU exempt a company from a regulation like this? How is that fair to the people of this state? How is this fair to the environment you are supposed to be protecting. IT IS NOT. The IDNR does not define what cost effective and economically unreasonable mean therefore letting companies to define these parts of the legislation for themselves. The IDNR must do scientific studies on the cost of various kinds of emissions, including health and environmental costs of emissions. Fracking in Illinois must be conducted in a manner that will protect public health and safety and prevent pollution if it is going to happen at all.

Sincerely, Kurt Witteman 425 S Wabash Ave WBRH 463 Chicago, IL 60605

The IDNR must do scientific studies on the cost of various kinds of emissions, including health and environmental costs of emissions. Fracking in Illinois must be conducted in a manner that will protect public health and safety and prevent pollution if it is going to happen at all.

Sincerely, Shawn Mukherji 491 Vaughn Cir Aurora, IL 60502

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Relevant parts of the Proposed Administrative Rules: 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

Sincerely, Ashely Ernst Chicago, IL 60605

Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

Sincerely, E Zemin Champaign, IL 61821

This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

Sincerely, Girwana Baker Chicago, IL 60605

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

Sincerely, Keri Curtis Peru, IL 61354

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

Sincerely, Mike Benz Chicago, IL 60645

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

Sincerely, Rachelle Ankney Chicago, IL 60626

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

Sincerely, Sarah Quesnell Chicago, IL 60605

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production To the Illinois Department of Natural Resources, To start off, I would first like to define the phrase “Volatile Organic Compounds”. According to the EPA, the general definition of VOCs is as follows: “any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions, except those designated by EPA as having negligible photochemical reactivity” (EPA, 2012). The composition of these VOCs allows them to evaporate “under normal indoor atmospheric conditions of temperature and pressure” (EPA, 2012). Beyond the general definition of VOCs, comes the many complications associated with these compounds. Also stated by the EPA, health impacts, resulting from VOCs, include “Eye, nose, and throat irritation; headaches, loss of coordination, nausea; damage to liver, kidney, and central nervous system” (EPA, 2012). Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” However, VOC emissions are generated by the fracking process, and I just got done showing that these substances have adverse health effects! Children and the elderly are even more prone to experiencing any of these associated health impacts from VOCs. The oil and gas industries are some of the top emitters of VOCs, so you may be wondering why I am dogging the fact that fracking also contributes to VOC emissions. I am addressing this because the proposed rules do not address how to mitigate VOCs that occur as a result of the fracking process at all! Using Colorado as an example, ozone-forming air pollution is about twice the amount that government regulators say can occur! Without appropriate regulations and rules in place, Illinois could find itself in a similar situation all because the current, drafted rules do not say, again, how to mitigate this! In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” Also, not surprisingly, the IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness”. By not defining these two terms companies are essentially left to define these terms for themselves and, to be honest, it is safe to assume that companies will make sure that they define it to their own benefit and strictly for profit, setting conscience aside. In turn, a cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while also socializing losses for taxpayers, adding an unjust burden to both local and state governments. Although I do not agree with the process of hydraulic fracturing coming to Illinois at all, I think that this section, or lack thereof, can be added/continuously improved upon within the drafted rules. In order to make this improvement/correction, I demand that the IDNR quantify the cost of various types of emissions by utilizing various, independent studies on this particular issue (seeing that the rules do not use any scientific studies at all, this could also be a way to make your proposed rules more credible overall). Both the health and environmental costs of these emissions (relative to the costs of capturing/reducing emissions) must also be included in this “quantification”. After being quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and

## Fair Economy Illinois

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” However, VOC emissions are generated by the fracking process, and I just got done showing that these substances have adverse health effects! Children and the elderly are even more prone to experiencing any of these associated health impacts from VOCs. The oil and gas industries are some of the top emitters of VOCs, so you may be wondering why I am dogging the fact that fracking also contributes to VOC emissions. I am addressing this because the proposed rules do not address how to mitigate VOCs that occur as a result of the fracking process at all! Using Colorado as an example, ozone-forming air pollution is about twice the amount that government regulators say can occur! Without appropriate regulations and rules in place, Illinois could find itself in a similar situation all because the current, drafted rules do not say, again, how to mitigate this! In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” Also, not surprisingly, the IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness”. By not defining these two terms companies are essentially left to define these terms for themselves and, to be honest, it is safe to assume that companies will make sure that they define it to their own benefit and strictly for profit, setting conscience aside. In turn, a cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while also socializing losses for taxpayers, adding an unjust burden to both local and state governments. Although I do not agree with the process of hydraulic fracturing coming to Illinois at all, I think that this section, or lack thereof, can be added/continuously improved upon within the drafted rules. In order to make this improvement/correction, I demand that the IDNR quantify the cost of various types of emissions by utilizing various, independent studies on this particular issue (seeing that the rules do not use any scientific studies at all, this could also be a way to make your proposed rules more credible overall). Both the health and environmental costs of these emissions (relative to the costs of capturing/reducing emissions) must also be included in this “quantification”. After being quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and

In reference to Subpart I: High Volume Horizontal Hydraulic Fracturing Production

Section 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Volatile Organic Compound (VOC) Emissions How does this affect me: Health and well-being Relevant parts of the Proposed Administrative Rules: 245.900 Managing Natural Gas and Hydrocarbon Fluids During Production Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” But fracking is inherently dangerous and polluting. Highly toxic Volatile Organic Compound or VOC emissions are generated by the fracking process and can cause irreversible neurological and or respiratory damage to children, adults, and other living things. VOCs have scientifically been shown to cause asthma, cancer, and severe illnesses. In extractive states, the largest contributor to VOCs is usually the oil and gas industry. This is the case in Colorado, where there have been many reported cases of illnesses from fracking pollution since the boom began. Ozone-forming air pollution measured in Colorado is up to twice the amount that government regulators have calculated should exist. Illinois can expect the same once fracking begins if the rules are not amended because, as currently drafted, the rules contain no best practice standards for mitigating VOCs. In fact, Sec 245.900e of the Rules allow companies to be wholly exempt from the regulation of runaway natural gas and hydrocarbon fluids if the regulation isn’t “cost effective” or if it is “economically unreasonable.” IDNR completely avoids defining “cost effectiveness” or “economically unreasonableness” – essentially allowing companies to define these terms for themselves. And we can assume that companies will make sure that they define it to their own benefit. A cost/benefit analysis that only calculates private costs of companies while ignoring the social costs on the people and the environment will result in privatizing profits for big corporations while socializing losses for taxpayers, adding an unjust burden to local and state governments. Solution: The Department must quantify the cost of various kinds of emissions utilizing independent scientific studies on this issue. Included in the quantification must be the health and environmental costs of emissions relative to the costs of capturing/reducing emissions. Once quantified, the Department must enact rules that carry out the legislative intent of the General Assembly and ensure that fracking operations in Illinois will be conducted in a manner that will protect the public health and safety and prevent pollution

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

Fracking causes subsidence, migration of gas, cancer clusters, and \$22,000 per cow killed by fracking is not enough compensation as humans are as susceptible to death by fracking as other mammals. Death and cancer are not advertised in fracking literature and the whole story cannot be told by frackers alone. A more sensible approach is possible if the easy, lazy process of fracking is shunted. Illinois environs have been destroyed too easily before this.

In reference to Subpart K: Enforcement

Section 245.110 Definitions  
Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

here are reasons why failure to adhere to section 1-70 must result in permit revocation: If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Automatic permit revocation for violations of Sec. 1-70 could prove to be one of the more effective ways to ensure higher levels of safety and environmental protection in areas where fracking will occur. If the IDNR is not serious about strict enforcement of Sections 245-520/580, then it has already nullified one of the most important set of regulatory standards for the oil and gas industry.

Sincerely, Jane Lee Naperville, IL 60564

In reference to Subpart K: Enforcement

Section 245.110 Definitions  
Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

My concern is the following: Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." This rule is too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. By not requiring immediate revocation, it is much more likely that Illinois neighborhoods will see well blow-outs, fires and explosions, death to workers, and pollution to the groundwater, air and soil. Other states have reported major problems with some companies who persistently engage in high-risk, cost-cutting measures that violate regulations. Illinois should not become another statistic!

Sincerely, Chris Christensen Arlington Hts, IL 60004

## Fair Economy Illinois

---

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

Permit revocation for violations of Sec. 1-70 by hydraulic fracturing companies would be effective in ensuring environmental protection and higher levels of safety in areas where hydraulic fracturing will occur. Fracturing companies will take advantage of these regulations, unless violations are treated as completely unacceptable.

Sincerely, Samuel Peiffer Woodstock, IL 60098

Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Automatic permit revocation for violations of Sec. 1-70 could prove to be one of the more effective ways to ensure higher levels of safety and environmental protection in areas where fracking will occur. If the IDNR is not serious about strict enforcement of Sections 245-520/580, then it has already nullified one of the most important set of regulatory standards for the oil and gas industry.

Sincerely, Adriana Caballero Oak Park, IL 60302

In reference to Subpart K: Enforcement

Section 245.110 Definitions  
Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

Section 245.1100 states that the Department may revoke for a wide variety of infractions: The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes... The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Section 245.110 Definitions  
Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

Section 245.1100 states that the Department may revoke for a wide variety of infractions: The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes... The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Automatic permit revocation for violations of Sec. 1-70 could prove to be one of the more effective ways to ensure higher levels of safety and environmental protection in areas where fracking will occur. If the IDNR is not serious about strict enforcement of Sections 245-520/580, then it has already nullified one of the most important set of regulatory standards for the oil and gas industry.

Sincerely, Brian Edward Anthony Menzel Chicago, IL 60608

That explosion claimed 11 lives and led to the largest environmental disaster in American History. Automatic permit revocation for violations of Sec. 1-70 could prove to be one of the more effective ways to ensure higher levels of safety and environmental protection in areas where fracking will occur. If the IDNR is not serious about strict enforcement of Sections 245-520/580, then it has already nullified one of the most important set of regulatory standards for the oil and gas industry.

Sincerely, Jan A Pietrzak 12031 S 72nd Ct Palos Heights, IL 60463

In reference to Subpart K: Enforcement

Section 245.110 Definitions  
Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

Section 245.1100 states that the Department may revoke for a wide variety of infractions: The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes... The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Automatic permit revocation for violations of Sec. 1-70 could prove to be one of the more effective ways to ensure higher levels of safety and environmental protection in areas where fracking will occur. If the IDNR is not serious about strict enforcement of Sections 245-520/580, then it has already nullified one of the most important set of regulatory standards for the oil and gas industry.

Sincerely, jd paulus wheaton, IL 60187

Automatic permit revocation for violations of Sec. 1-70 could prove to be one of the more effective ways to ensure higher levels of safety and environmental protection in areas where fracking will occur. If the IDNR is not serious about strict enforcement of Sections 245-520/580, then it has already nullified one of the most important set of regulatory standards for the oil and gas industry.

In reference to Subpart K: Enforcement

Section 245.110 Definitions  
Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

Section 245.1100 states that the Department may revoke for a wide variety of infractions: The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes... The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Automatic permit revocation for violations of Sec. 1-70 could prove to be one of the more effective ways to ensure higher levels of safety and environmental protection in areas where fracking will occur. If the IDNR is not serious about strict enforcement of Sections 245-520/580, then it has already nullified one of the most important set of regulatory standards for the oil and gas industry.

Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Automatic permit revocation for violations of Sec. 1-70 could prove to be one of the more effective ways to ensure higher levels of safety and environmental protection in areas where fracking will occur. If the IDNR is not serious about strict enforcement of Sections 245-520/580, then it has already nullified one of the most important set of regulatory standards for the oil and gas industry.

Sincerely, Keri Curtis Peru, IL 61354

In reference to Subpart K: Enforcement

Section 245.110 Definitions  
Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

Students in school automatically fail a course if they plagiarize. People with DUIs automatically have their license suspended. But according to the IDNR rules, fracking operators may or may not have their permits revoked if they do not abide by guidelines in building or testing a well. This doesn't even begin to make sense. Because fracking operations pose serious occupational and public health risks, permits should automatically be revoked for violating well testing or building guidelines. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

This comment relates to 245.1100, administrative sanctions. I believe this section should include a provision to require IDNR to revoke the permit if the company fails to comply with sec. 1-70 of the Hydraulic Fracking Regulatory Act. These sections deal with development and testing of drilling operations, and are critical to preventing outcomes like well blowouts, fires, explosions, and pollution of groundwater, including aquifers. Companies that fail to follow these industry standard safety provisions should not be allowed to operate in Illinois.

Sincerely, Eileen Sutter 4125 North Monticello Chicago, IL 60618

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Alen Makhmudov Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Ammar Kalimullah Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Anna Betts Chicago, IL 60607

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Benjamin Boyajian Chicago, IL 60615

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Bing Li Chicago, IL 60608

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Brian Menzel Chicago, IL 60608

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Carolyn Treadway Normal, IL 61761

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Clara Kao Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Donovan Snyder Snyder Chicago, IL 60605

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions  
Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Dylan Amlin Chicago, IL 60605

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Elizabeth Scrafford chicago, IL 60626

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Emma LaBounty Chicago, IL 60615

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Frank Pettis Chicago, IL 60605

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Grace Pai Chicago, IL 60615

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Hannah Kershner Galena, IL 61036

In reference to Subpart K: Enforcement

Section 245.110 Definitions  
Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Jay Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Jessa Dahl Chicago, IL 60615

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Joe Kapran Chicago, IL 60615

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Joseph Gary New York, IL 10003

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-errorcausedchesapeakegas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-errorcausedchesapeakegas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowoutaskedto-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowoutaskedto-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Ken Buck Naperville, IL 60540

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Kiehlor Mack Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Louis Clark Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Maheema Haque Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Michael Perino Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Nancy Penney Monticello, IL 61856

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Nicholas Andrew Luthi Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Padgham Larson Galena, IL 61036

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Rachel Katz Chicago, IL 60615

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Ramon Valladarez Chicago, IL 60642

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Roberta Weiner Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Roberta Weiner Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

Fifty residents evacuated Location: Converse County, WY Gas Facility: Chesapeake Gas well blowout Exposure: Water; air - well vented 2 million cubic feet of gas and 31,500 gallons of oil based drilling "mud" over three days Symptoms: Evacuation of homes  
[http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Samantha Martin Chicago, IL 60605

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Sasha Mitrofanenko Chicago, IL 60605

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Ta Promlee Chicago, IL 60645

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. [http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article\\_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html](http://trib.com/news/state-and-regional/report-mechanical-failure-worker-error-caused-chesapeake-gas-well-blowout/article_6c1ed0be-9ab8-11e1-a91b-0019bb2963f4.html) [http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article\\_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html](http://trib.com/news/state-and-regional/residents-near-wyoming-gas-well-blowout-asked-to-evacuate/article_aba5a4e2-0c3e-59f8-bdce-f7c9f496fdf0.html) The Deepwater Horizon blowout and explosion at British Petroleum's Macondo well. This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Tim Law Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

This explosion claimed 11 lives and caused the worst environmental disaster in American history. This disaster was caused by shoddy well construction (e.g., inadequate cementing) and failure to pay heed to mechanical integrity tests. Solution: Require automatic permit revocation for violating well construction standards or disregarding failed well integrity tests. Also, drop §245.1110(b) 3A; it imposes both an undefined and impossibly high legal hurdle (the "significant threat" phrase) before IDNR can issue permit suspensions. We believe this section takes a precautionary note directed to drillers, turns it on its head, and directs it against the agency. In our estimation, this rule misconstrues the intent of the General Assembly and therefore limits the scope of the law.

Sincerely, Vik Lobo Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas

In reference to Subpart K: Enforcement

Section 245.110 Definitions Section 245.1100 Suspension, Revocation, Remediation and Administrative Penalties

We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5- 100(d)]. Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Some sections of the law are so important that the only appropriate response is automatic permit revocation. In reference to Subpart K: Enforcement

### Section 245.1110 Notice of Violation

For regulations to work, levied fines must exceed the financial benefit a company gains by violating the rules. None of the rulemaking sanctions meet this criterion. This results in the other 150 pages of rules being essentially meaningless because they will be ignored. The draft rule sanctions place the Hydraulic Fracturing Regulatory Act (HFRA) on the road to failure before the first permit is issued. Examples: Section 1-100(b) of the law specifies misdemeanor and felony criminal charges for a number of violations of the law. Yet there are NO criminal charges in the rules. In Section 1-60(a)1-6 of the law, there are six (6) grounds for suspension or revocation of a permit. These are re-listed with a 7th in section 245.1100 of the rules. But the very next section of the Rules--245.1110--reduces the grounds for an immediate permit suspension to one: "an emergency condition posing a significant hazard to the public health, aquatic life, wildlife or the environment." This is the most stringent requirement of the seven grounds listed in section 245.1100. Why bother to list seven possible grounds for permit suspension or revocation in section 245.1100 if you then require the Department to identify the most stringent criteria for an immediate suspension. Section 1-60(b) of the law requires a much lower standard of proof to suspend, revoke or deny a permit than the rules (245.1110). Under the law, the Department need only serve notice of its action (to suspend, revoke or deny), including a statement of the reasons for the action. In the law, if a well operator's permit has been suspended, the burden of proof is on well operator to prove that the identified problem is "no significant threat to public health, aquatic life, wildlife, or the environment" [Section 1-60(d)]. In the rules, this phrase becomes something IDNR must prove before ordering a permit suspension [Rule Section 245.1100(b)3A]. Sections 1-100 and 1-101 of the law have some stiff penalties that accrue on a daily basis until the reason for the fine is corrected. These fines can go as high as \$50,000 per violation and up to \$10,000 per day. These are replaced by fines so trivial (\$50-\$2500) that it will cost the IDNR more to impose and collect a fine than the dollar value of the fine itself. Revisions Needed: Return to the standards of the law with regard to fines, penalties and revocations.

Sincerely, Raymond D. Gayton 453 Tahoe Street Park Forest, IL 60466

In reference to Subpart K: Enforcement

Section 245.1120 Director's Decision

IDNR proposes to fine violators of the rules from \$50 (less than a typical traffic ticket) to \$2500 dollars per violation, up to \$1000 for actually causing environmental harm, and up to \$2000 for "creating a hazard to the safety of any person". Keep in mind these are fines for companies making potentially tens of millions of dollars — or in many cases — even more. Note that the top 5 oil and gas producers — Exxon-Mobil, Shell, Chevron, BP, and Conoco Phillips — made 118.1 billion in profits last year; in the last decade alone they have brought in over 1 trillion in profits. Where is there deterrence in these penalties for the inevitable "accidents"? Let us answer that: there is none.

Sincerely, B. E. Murphy 458 Tahoe Park Forest, IL 60466

In reference to Subpart K: Enforcement

### Section 245.1120 Director's Decision

Corporations exist for one purpose: profit. Big banks, fossil fuel companies, all sorts of companies have throughout history have broken laws, poisoned our environment, and endangered human lives for the sake of profit. The only way to ensure corporations follow the law and protect us and our environment is to make it more expensive to break the law than it is to follow the law. The rules drafted by the IDNR contain minimal fines on corporations for very serious violations of human and environmental safety. Fines start at a token \$50 per violation and only go up to \$2500 violation (Sec. 245.200). In fact, the fines in the rules are technically lower than the daily fines specified in the original legislation. Furthermore, Sec. 245.1120 discounts violations from companies if they are more than 2 years old. There is no reason violations should expire in this manner. The same section (Sec. 245.1120(i)) also inappropriately limits the Director IDNR's actions to simply relaxing the terms of prior decisions. This would severely limit the Director's ability to impose more stringent penalties as a tradeoff for relaxing other terms. The top 5 producers of oil and gas made over 118 billion in profits last year. A \$50 or \$2500 fine will not slow these corporations down. This is akin to police stopping someone for speeding through a construction zone and hitting a worker and then writing them a ticket for 5 cents. The cost of polluting the groundwater of over 800,000 Illinoisans, the cost of illness and cancer caused by contaminated water and air, the cost of brain damage caused by toxic fumes -- these should be reflected in the fines. The costs of violations of the rules need to be higher than the millions of dollars in profits that corporations stand to gain from fracking our water and land.

Sincerely, Kelvin Ho 736 W. 43rd St. (Apt. 3) Chicago, IL 60609

## Fair Economy Illinois

---

In reference to Subpart K: Enforcement

Section 245.1120 Director's Decision

Fines are structured into laws to discourage individuals and companies from doing harm to society. When fines are as ridiculously low as the ones IDNR proposes, they have no effect at all. Didn't we learn anything from the housing crisis and the resulting financial meltdown? When it is more profitable for a company to break the law and pay a fine than for the company to follow the law and not pay a fine, it is inevitable that the company will do what is most profitable for them.

Sincerely, ron kurowski tinley park, IL 60477

## Fair Economy Illinois

---

In reference to Subpart K: Enforcement

### Section 245.1120 Director's Decision

From the rules: "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." This is excellent for municipalities, but what about counties? - The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. - This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Carbondale, Marion, Decatur or other metro areas affected by the majority of fracking land leases. If prior notification and an intentional process of permitting is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? - There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making. - Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. - There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties?

Sincerely, Gus Novoa Chicago, IL 60637

In reference to Subpart K: Enforcement

Section 245.1120 Director's Decision

How can the IDNR effectively monitor the adverse affects of mining? Is your goal to serve the gas and oil industry or the citizens of Illinois? My guess is that you are following the money and I am afraid that decision will have grave repercussions. Who will be accountable as we evolve into another Pennsylvania or Wisconsin mirroring the same fracing and frac sand horror stories that have come out of those states? Why would an entity as large as the fracing industry be concerned about the measly fines that they are given for environmental accidents. To them these fines are just part of doing business as usual. The monetary rewards they accrue far outweigh the cost to the environment or the tiny dents the fines make in their bottom line.

Sincerely, Joy Konczak 1116 N 2803 Rd Utica, IL 61373

## Fair Economy Illinois

---

In reference to Subpart K: Enforcement

Section 245.1120 Director's Decision

iDNR identifies the definition of an "Affected patient" as "a person receiving health care services from a health professional for an illness or injury diagnosed by the health professional to be caused by exposure to any chemicals used in high volume horizontal hydraulic fracturing operations that are subject to a claim of trade secret by a permittee or contractor." PROBLEM – This definition is circular: in order to learn what chemical was used, a physician must first test for it so he can prove he has a right to disclosure of the proprietary chemical. How can a doctor diagnose exposure to a secret chemical used in high volume fracking before he knows which chemicals to test for?

Sincerely, Gus Novoa Chicago, IL 60637

Keep in mind these are fines for companies making potentially tens of millions of dollars — or in many cases — even more. Note that the top 5 oil and gas producers — Exxon-Mobil, Shell, Chevron, BP, and Conoco Phillips — made 118.1 billion in profits last year; in the last decade alone they have brought in over 1 trillion in profits. Where is there deterrence in these penalties for the inevitable "accidents"? Let us answer that: there is none. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

## Fair Economy Illinois

---

In reference to Subpart K: Enforcement

Section 245.1120 Director's Decision

IDNR proposes to fine violators of the rules from \$50 (less than a typical traffic ticket) to \$2500 dollars per violation, up to \$1000 for actually causing environmental harm, and up to \$2000 for "creating a hazard to the safety of any person". Keep in mind these are fines for companies making potentially tens of millions of dollars — or in many cases — even more. Note that the top 5 oil and gas producers — Exxon-Mobil, Shell, Chevron, BP, and Conoco Phillips — made 118.1 billion in profits last year; in the last decade alone they have brought in over 1 trillion in profits. Fines are designed to stop the offense from happening again. If I, a college student with a part-time, minimum-wage income, got a \$150 speeding ticket, you can bet that I wouldn't do it again. Fines must be prohibitively expensive--it should cost more to break the law than to follow it. But where is there deterrence in Illinois' penalties for fracking companies' inevitable "accidents"? Let me answer that: there is none.

Sincerely, Brianna Tong 5122 S University Ave (#1) Chicago, IL 60615

IDNR proposes to fine violators of the rules from \$50 (less than a typical traffic ticket) to \$2500 dollars per violation, up to \$1000 for actually causing environmental harm, and up to \$2000 for "creating a hazard to the safety of any person". Keep in mind these are fines for companies making potentially tens of millions of dollars — or in many cases — even more. Note that the top 5 oil and gas producers — Exxon-Mobil, Shell, Chevron, BP, and Conoco Phillips — made 118.1 billion in profits last year; in the last decade alone they have brought in over 1 trillion in profits. Where is there deterrence in these penalties for the inevitable "accidents"? Let us answer that: there is none. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Panelli Juliana 12051 Mackinac Rd Homer Glen, IL 60491

### Section 245.1120 Director's Decision

IDNR proposes to fine violators of the rules from \$50 (less than a typical traffic ticket) to \$2500 dollars per violation, up to \$1000 for actually causing environmental harm, and up to \$2000 for "creating a hazard to the safety of any person". Keep in mind these are fines for companies making potentially tens of millions of dollars — or in many cases — even more. Note that the top 5 oil and gas producers — Exxon-Mobil, Shell, Chevron, BP, and Conoco Phillips — made 118.1 billion in profits last year; in the last decade alone they have brought in over 1 trillion in profits. As a lawyer, I can assure you that businesses don't care about right and wrong. They care about the cost of doing business. No business is going to think twice about taking safety shortcuts (which they will convince themselves are not very risky anyway) when the consequence of being caught is a fine of \$50. They will take the shortcuts -- which save thousands of dollars time after time. Even when the inevitable accidents happen, a simple cost-benefit analysis says that it is better to just take the shortcuts and then pay this de minimus fine. Consequently, these penalties are completely unreasonable and irrational. The purpose of a fine is to deter undesirable favor. A fine must be large enough in proportion to the profits being made in order to have any effect. Let us answer that: there is none.

Sincerely, Richard Fedder Carbondale, IL 62901

### Section 245.1120 Director's Decision

Illinois citizens pay more for speeding, violating parking ordinances, or even losing a library book than many of these corporations would pay for violating IDNR regulations. Often times, these fines on regular people are not sufficient deterrents to the undesired behavior. How are we to expect that these fines will deter corporations, whose pocket books are much deeper, from illegal activity? This is unacceptable. IDNR proposes to fine violators of the rules from \$50 (less than a typical traffic ticket) to \$2500 dollars per violation, up to \$1000 for actually causing environmental harm, and up to \$2000 for "creating a hazard to the safety of any person". Section 245.1120 Director's Decision

in section 245.1120 the fines for violations of the regulations are extremely low considering the permit applicants are making billions of dollars a year. This creates no incentive for the industry to adhere to any sort of standard. However, any fine proposed would completely undermine the external costs and the people that have to deal with them. And although fracking cannot be made safe by any means, fines should be in the millions or billions of dollars. A billion dollars may seem harsh, but when we are dealing with highly toxic chemicals that can kill people. Peoples lives, whole economies and much more are at stake. I will end with saying PLEASE DON'T FRACK MY LAND!

Sincerely, sam schall 104 w mill st carbondale, IL 62901

## Fair Economy Illinois

---

In reference to Subpart K: Enforcement

### Section 245.1120 Director's Decision

Legal issues: We can find no instance where permit revocation is specified for the most serious and willful violations of the Act even though such violations "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens" [5 ILCS 100/5-115(a)]. We believe this omission is an "incomplete" and "deficient" act of rulemaking [5 ILCS 100/5-100(d)]. In addition, the civil penalties in the Act [§1-60], namely = $\$50,000$  per violation + an additional  $\$10,000$  per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at  $\$50$  and increasing to  $\$500$  for =4 violations. Operating violations begin at  $\$100$  and increase to  $\$1,000$  for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." Implications: The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Consequences: Some sections of the law are so important that the only appropriate response is automatic permit revocation. In our estimation, Act § 1-70(d) & (e) and Rules § 245.520 through § 245.580 are the most important sections in the law. If a well is shoddily constructed and/or fails to meet mechanical integrity standards given by the American Petroleum Institute, lots of very bad things can happen. Imagine motorists driving cars with brakes that don't work, shocks that are shot, and a steering wheel that cannot keep the car in one lane. Accidents will happen in this inherently dangerous industry, but this instance of regulatory abdication ensures that lots of very costly, unnecessary, and harmful accidents will happen. The objective of this section of the law and rules is to reduce the risks of well blowouts, fires and explosions, along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. Consider only these three examples: 665-689. Dick Bilodeau, Deb Thomas and 24 other families (<http://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list/>) Location: Clark, WY Gas Facility: Windsor Energy gas wells Exposure: Air - 5 million to 7 million cubic feet of gas was discharged into the air during the 58-hour incident; water- benzene, acetone, carbon disulfide and others Symptoms: 25 homes were evacuated, Fort Union bedrock aquifer polluted, the blowout resulted in a 10 million cubic foot plume of groundwater contamination, or more than 100 Olympic- size swimming pools worth. <http://billingsgazette.com/news/state-and-regional/wyoming/clark->

In reference to Subpart K: Enforcement

Section 245.1120 Director's Decision

Number of draft regulations proposed by Illinois Dept. of Natural Resources describing safety measures regarding tornado strikes on fracking sites: ZERO. Number of tornadoes in Illinois in the last 10 years: 674. Historically, the number and intensity of tornadoes in Illinois is very high. "In fact, Illinois has experienced some of the worst tornadoes in US history." Dr. Jim Angel, Illinois State Climatologist. Every county in Illinois has had multiple tornadoes as demonstrated by the maps in the following links:  
<http://www.isws.illinois.edu/atmos/statecli/tornado/ilmaps.htm>  
[http://www.isws.illinois.edu/atmos/statecli/tornado/NewMaps/MRCC\\_TornadoTracks\\_1950.png](http://www.isws.illinois.edu/atmos/statecli/tornado/NewMaps/MRCC_TornadoTracks_1950.png) A big swath of Washington, IL was flattened by a tornado on Sunday, 11/17/13. What would have happened if this tornado had hit an area of the state covered in fracking sites? Debris from the tornado has been found over 150 miles away. Imagine if that debris had included "temporarily" stored flowback water or tanks filled with frack fluid or produced water!

Sincerely, Gus Novoa Chicago, IL 60637

In reference to Subpart K: Enforcement

### Section 245.1120 Director's Decision

Section 245.1100 states that the Department may revoke for a wide variety of infractions: "The Department may, through the enforcement process set forth in this Subpart, suspend or revoke a high volume horizontal hydraulic fracturing permit, order actions to remediate, or issue administrative penalties for one or more of the following causes..." The rules are too lax when the violation involves failing to follow guidelines when building/developing a well or testing its integrity. In those circumstances, the rules should require mandatory revocation of the permit. Rationale: Provisions in Section 1-70 of the Hydraulic Fracturing Regulatory Act (Well preparation, construction, and drilling) require adherence to the American Petroleum Institute (API) standards when developing and testing oil and gas wells. A strong case can be made that these are the most important sections in the law because their objective is to reduce the risks of well blowouts, fires and explosions along with the attendant risks of injury or death to workers, adverse public health outcomes to nearby residents, and the pollution of groundwater, air, and soil. There are reasons why failure to adhere to section 1-70 must result in permit revocation: - If well operators shortcut the well development standards in Sec. 1-70 or if the well fails any of the required tests in Sec. 1-70, the adverse events cited above become much more likely. Pollution of aquifers is also much more likely and this pollution can be easily overlooked. - Other states have experienced major problems with some rogue companies that systematically and persistently engage in high-risk, cost-cutting violations of regulations, such as these. If some companies are allowed to violate Section 1-70, others will follow their lead. - It was the violation of the provisions in Sec. 1-70 that led to the Deepwater Horizon explosion in the Gulf of Mexico on 20 April 2010. That explosion claimed 11 lives and led to the largest environmental disaster in American History. Automatic permit revocation for violations of Sec. 1-70 could prove to be one of the more effective ways to ensure higher levels of safety and environmental protection in areas where fracking will occur. If the IDNR is not serious about strict enforcement of Sections 245-520/580, then it has already nullified one of the most important set of regulatory standards for the oil and gas industry.

Sincerely, Gus Novoa Chicago, IL 60637

Section 245.1120 Director's Decision

Suggested Comment: IDNR proposes to fine violators of the rules from \$50 (less than a typical traffic ticket) to \$2500 dollars per violation, up to \$1000 for actually causing environmental harm, and up to \$2000 for "creating a hazard to the safety of any person". Keep in mind these are fines for companies making potentially tens of millions of dollars — or in many cases — even more. Note that the top 5 oil and gas producers — Exxon-Mobil, Shell, Chevron, BP, and Conoco Phillips — made 118.1 billion in profits last year; in the last decade alone they have brought in over 1 trillion in profits. Where is there deterrence in these penalties for the inevitable "accidents"? Let us answer that: there is none

Sincerely, Andrew Panelli 12051 Mackinac Rd Homer Glen, IL 60491

### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, , IL

### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, , IL

Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, , IL

### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, , IL

All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Amelia Dmouska Chciago, IL 60637

### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Camil Machaj Lemont, IL 60439

### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, E Zemin Champaign, IL 61821

The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Glen Edward Litchfield Darien, IL 60561

### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. ### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Karina Hendren Chicago, IL 60637

In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Maheema Haque Chicago, IL 60637

If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Nora Helfand Chicago, IL 60637

### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? ### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Roberta Weiner Chicago, IL 60637

All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Scott Condren Chicago, IL 60608

### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Sincerely, Tybee McLaughlin Chicago, IL 60605

### Section 245.1120 Director's Decision

The civil penalties in the Act [§1-60], namely = \$50,000 per violation + an additional \$10,000 per day of violation, is absent from the rules. In their place are discretionary administrative rules violations beginning at \$50 and increasing to \$500 for =4 violations. Operating violations begin at \$100 and increase to \$1,000 for =4 violations. How this discretionary power is to be "affirmed, vacated or modified" is stated in vague, general language and therefore lacks the "precise" and "clear" standards required under 5 ILCS 100/5-20. All in all, we believe these rules represent a troubling and exceptionally consequential effort to "limit the scope of the law." The fundamental principle in any regulatory regime is to employ sufficiently costly sanctions that Company A will not undercut Companies B thru X by polluting with impunity. If the fines or sanctions are trivial, Company A will pollute with abandon because it gains a price advantage over all other companies who play by the rules. The end result is regulatory abdication: every company violates the rules because it is the only way to remain economically competitive. By way of example, imagine a motorist who, speeding at 90 mph, hits a worker in an interstate construction zone. The State Police pull him over and give him a 5¢ ticket. The motorist's response? Once the officer is out of sight, resume driving at 90 mph. In summary: these instances of rulemaking eviscerate PA98-0022. It is stripped of meaningful sanctions and can therefore no longer function as a "regulatory" law. Revisions needed: Write PA98-0022 fines and penalties into the rules; strip out the trivial fines in §245.1120(c)1-2

Section 245.1120 Director's Decision

The fines proposed are ridiculously low. These corporations are making millions, and some billions. These fines should be correctly proportioned to their income levels. It is not ok for them to break the rules. Putting a small price on the violations would make the companies not pay attention to the rules because they have a small price to pay.

Sincerely, Tommy Talley 3354 E 106th St Chicago, IL 60617

Section 245.1120 Director's Decision

These fines are abhorrently low and carelessly drawn up! These violations ARE with out a doubt INEVITABLE. Is \$1,000 compensation for habitat degradation and loss of biodiversity or a string of earthquakes and methane geysers? Is \$2,000 compensation for permanent devastation to a person's water supply or a mother giving birth to a stillborn baby after being exposed to fracking fluids? Respectively, HELL NO! I refuse to support this illconceived rule.

Sincerely, Ashley Williams Ottawa, IL 61350

These fines are ridiculous. Is this some kind of joke?

Sincerely, Ruben Rodriguez Harvard, IL 60033

In reference to Subpart K: Enforcement

Section 245.1120 Director's Decision

This section of the rules states that every applicant applying for a permit must disclose to the Department “all findings of a serious violation or an equivalent violation under federal, Illinois or other state laws or regulations in the development or operation of an oil or gas exploration or production site via hydraulic fracturing by the registrant or any parent, subsidiary, or affiliate of the registrant within the previous 5 years.” - What does IDNR define as a “serious” violation? There is no guideline here making it easy for violators to claim that they didn’t report a violation because “we didn’t think it was serious.” Instead, applicants should be required to disclose ALL violations alleged by public authorities and any fines or findings therefrom. - What is the reason for the 5 year time limitation? When fracking violations potentially pose a threat to public health and safety, all previous violations and alleged violations should be considered when issuing a permit, regardless of how long ago they occurred.

Sincerely, Gus Novoa Chicago, IL 60637

When I saw the proposed fine schedule, I thought it was a joke. The fines should be exponentially higher-- on the scale of air, soil and water pollution fines typically levied by EPA for environmental violations which damage public health.

Sincerely, Marsha Love Chicago, IL 60612

When you fine so lightly, you give the go ahead for mega buck corporations to do whatever they please. ACT as if you are concerned about violations of safety regulations by hitting the corporations where is hurt---in their pocket books. Fines should make them fear breaking safety regulations, not scoff at the possibility.

Sincerely, Esther Allman 984 North Butternut Frankfort, IL 60423

Why are the penalties (in proportion to profits made by the industry) so low, even though there are cases in many states (PA, CO, TX etc) of negligent practices and willful dumping of toxic materials into water ways?

Sincerely, Seth Brecklin 4651 N Knox Chicago, IL 60630
