In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Problems with this section: First and foremost, Section 245.210 states that every applicant for a permit under this Part "must submit" certain information, including a Chemical Disclosure Report identifying each chemical and proppant anticipated to be used in hydraulic fracturing fluid for each state of the high volume horizontal hydraulic fracturing operations. However, Section 245.210(a)(8) allows an applicant to postpone submission of a Chemical Disclosure Report if it "documents to the Department's satisfaction why the information is not available at the time the application is submitted […]" Why these are problems: The criteria for documenting "to the Department's satisfaction" are subjective, vague, and ambiguous. Fracking operators should not be able to unilaterally determine postponement of chemical disclosure report under any circumstances. Obviously, if the operator is aware of the chemical they are using there should be no allowance for delay in disclosure to IDNR. If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Non-disclosure in any fashion upon filing the required Chemical Disclosure Report must be determined by the Department as grounds for not approving, or revocation of the permit.

Sincerely, Dakota Dompke Belleville, IL 62221

If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Non-disclosure in any fashion upon filing the required Chemical Disclosure Report must be determined by the Department as grounds for not approving, or revocation of the permit.

Sincerely, Jady YTolda chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Problems with this section: First and foremost, Section 245.210 states that every applicant for a permit under this Part "must submit" certain information, including a Chemical Disclosure Report identifying each chemical and proppant anticipated to be used in hydraulic fracturing fluid for each state of the high volume horizontal hydraulic fracturing operations. However, Section 245.210(a)(8) allows an applicant to postpone submission of a Chemical Disclosure Report if it "documents to the Department's satisfaction why the information is not available at the time the application is submitted […]" Why these are problems: The criteria for documenting "to the Department's satisfaction" are subjective, vague, and ambiguous. Fracking operators should not be able to unilaterally determine postponement of chemical disclosure report under any circumstances. Obviously, if the operator is aware of the chemical they are using there should be no allowance for delay in disclosure to IDNR. If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Non-disclosure in any fashion upon filing the required Chemical Disclosure Report must be determined by the Department as grounds for not approving, or revocation of the permit.

However, Section 245.210(a)(8) allows an applicant to postpone submission of a Chemical Disclosure Report if it "documents to the Department's satisfaction why the information is not available at the time the application is submitted […]" Why these are problems: The criteria for documenting "to the Department's satisfaction" are subjective, vague, and ambiguous. Fracking operators should not be able to unilaterally determine postponement of chemical disclosure report under any circumstances. Obviously, if the operator is aware of the chemical they are using there should be no allowance for delay in disclosure to IDNR. If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Non-disclosure in any fashion upon filing the required Chemical Disclosure Report must be determined by the Department as grounds for not approving, or revocation of the permit.

Sincerely, Kayli Horne Chicago, IL 60615

Section 245.210 Permit Application Requirements

Problems with this section: First and foremost, Section 245.210 states that every applicant for a permit under this Part "must submit" certain information, including a Chemical Disclosure Report identifying each chemical and proppant anticipated to be used in hydraulic fracturing fluid for each state of the high volume horizontal hydraulic fracturing operations. However, Section 245.210(a)(8) allows an applicant to postpone submission of a Chemical Disclosure Report if it "documents to the Department's satisfaction why the information is not available at the time the application is submitted […]" Why these are problems: The criteria for documenting "to the Department's satisfaction" are subjective, vague, and ambiguous. Fracking operators should not be able to unilaterally determine postponement of chemical disclosure report under any circumstances. Obviously, if the operator is aware of the chemical they are using there should be no allowance for delay in disclosure to IDNR. Section 245.210 Permit Application Requirements

Problems with this section: First and foremost, Section 245.210 states that every applicant for a permit under this Part "must submit" certain information, including a Chemical Disclosure Report identifying each chemical and proppant anticipated to be used in hydraulic fracturing fluid for each state of the high volume horizontal hydraulic fracturing operations. However, Section 245.210(a)(8) allows an applicant to postpone submission of a Chemical Disclosure Report if it "documents to the Department's satisfaction why the information is not available at the time the application is submitted […]" Why these are problems: The criteria for documenting "to the Department's satisfaction" are subjective, vague, and ambiguous. Fracking operators should not be able to unilaterally determine postponement of chemical disclosure report under any circumstances. Obviously, if the operator is aware of the chemical they are using there should be no allowance for delay in disclosure to IDNR. If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Non-disclosure in any fashion upon filing the required Chemical Disclosure Report must be determined by the Department as grounds for not approving, or revocation of the permit.

Sincerely, Mary Ellen Barbezat Elgin, IL 60120

Fracking operators should not be able to unilaterally determine postponement of chemical disclosure report under any circumstances. Obviously, if the operator is aware of the chemical they are using there should be no allowance for delay in disclosure to IDNR. If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Non-disclosure in any fashion upon filing the required Chemical Disclosure Report must be determined by the Department as grounds for not approving, or revocation of the permit.

Sincerely, Preethi Sekhar Naperville, IL 60564

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Problems with this section: First and foremost, Section 245.210 states that every applicant for a permit under this Part "must submit" certain information, including a Chemical Disclosure Report identifying each chemical and proppant anticipated to be used in hydraulic fracturing fluid for each state of the high volume horizontal hydraulic fracturing operations. However, Section 245.210(a)(8) allows an applicant to postpone submission of a Chemical Disclosure Report if it "documents to the Department's satisfaction why the information is not available at the time the application is submitted […]" Why these are problems: The criteria for documenting "to the Department's satisfaction" are subjective, vague, and ambiguous. Fracking operators should not be able to unilaterally determine postponement of chemical disclosure report under any circumstances. Obviously, if the operator is aware of the chemical they are using there should be no allowance for delay in disclosure to IDNR. If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Section 245.210 Permit Application Requirements

Problems with this section: First and foremost, Section 245.210 states that every applicant for a permit under this Part "must submit" certain information, including a Chemical Disclosure Report identifying each chemical and proppant anticipated to be used in hydraulic fracturing fluid for each state of the high volume horizontal hydraulic fracturing operations. However, Section 245.210(a)(8) allows an applicant to postpone submission of a Chemical Disclosure Report if it "documents to the Department's satisfaction why the information is not available at the time the application is submitted […]" Why these are problems: The criteria for documenting "to the Department's satisfaction" are subjective, vague, and ambiguous. Fracking operators should not be able to unilaterally determine postponement of chemical disclosure report under any circumstances. Obviously, if the operator is aware of the chemical they are using there should be no allowance for delay in disclosure to IDNR. If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Non-disclosure in any fashion upon filing the required Chemical Disclosure Report must be determined by the Department as grounds for not approving, or revocation of the permit.

Sincerely, Sam Vexler Chicago, IL 60637

If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Non-disclosure in any fashion upon filing the required Chemical Disclosure Report must be determined by the Department as grounds for not approving, or revocation of the permit.

Sincerely, Tybee McLaughlin Chicago, IL 60605

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Problems with this section: First and foremost, Section 245.210 states that every applicant for a permit under this Part "must submit" certain information, including a Chemical Disclosure Report identifying each chemical and proppant anticipated to be used in hydraulic fracturing fluid for each state of the high volume horizontal hydraulic fracturing operations. However, Section 245.210(a)(8) allows an applicant to postpone submission of a Chemical Disclosure Report if it "documents to the Department's satisfaction why the information is not available at the time the application is submitted […]" Why these are problems: The criteria for documenting "to the Department's satisfaction" are subjective, vague, and ambiguous. Fracking operators should not be able to unilaterally determine postponement of chemical disclosure report under any circumstances. Obviously, if the operator is aware of the chemical they are using there should be no allowance for delay in disclosure to IDNR. If they do not know what chemicals they are using, that should be an automatic acknowledgment they are not capable of safe operation and not be granted a permit. Needed changes: INDR must require prior disclosure of all chemicals used in the operation with no exceptions. Non-disclosure in any fashion upon filing the required Chemical Disclosure Report must be determined by the Department as grounds for not approving, or revocation of the permit.

Section 245.210 Permit Application Requirements

Residents of cities, villages and incorprated areas can voice their opinions in regard to fracking. How will those in rural areas make their wishes known?

Sincerely, Genarose Buechler Red Bud, IL 62278

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: If fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, M Alan Wurth Red Bud, IL 62278

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Aija Nemer-Aanerud Chicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). I would like to see the following changes: -The rules must require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. The local government should have authority to deny water to a frack well operator, even in the case of drought. -The rules must establish a process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. -The rules must set minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why I'm advocating for these changes: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Ammar Kalimullah Chicago, IL 60637

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Britni Austin Chicago, IL 60605

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Curtis Morris Chicago, IL 60607

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Dylan Amlin Chicago, IL 60605

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Eve Zuckerman CHicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Harry Li 2656 Boddington Lane Naperville, IL 60564

Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Jesse Silliman Chicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Jessica Green Chicago, IL 60637

A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Kathy Machaj Chicago, IL 60607

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Leilani Douglas Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Lupita Carrasquillo Chicago, IL 60605

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Mary Ellen Barbezat Elgin, IL 60120

If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Micah Bennett Marion, IL 62959

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Mike Benz Chicago, IL 60645

By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Nour Abdelmonem Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Ramon Valladarez Chicago, IL 60642

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Rohit Satishchandra Chicago, IL 60637

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Sandra Nickerson West Dundee, IL 60118

IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Sarah Quesnell Chicago, IL 60605

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Sasha Mitrofanenko Chicago, IL 60605

According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, sonja chan 944 w walnut st kankakee, IL 60901

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, Veronica Murashige Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. From July to December 2012 the area was in continuous drought. Two of three local areas identified as “at risk public water supply” are in potential frack operation counties (Macon, Johnson, IL). These counties were identified in an IL EPA 2012 drought report as having Community Water Systems most stressed by the drought. A report by the East Central IL Regional Water Supply Planning Committee identified: Springfield has a greater than 50% probability their water system will be unable to meet projected water use with a drought of record. By 2020, Bloomington and Decatur's water systems will be inadequate to meet demand. The average water use by a frack operator is significant and will have an impact on water usage. According to federal EPA, the average frack uses 4.4 million gallons of water. And wells can be fracked multiple times. Needed changes: Any governmental unit that involves itself in local or regional water issues must review the frack operator water source management plan with the power to affirm, reject or modify the plan. If a county or geographic area is identified as being in a drought, frack operations will cease. IDNR must develop scientifically based high minimum, specific standards of water usage protecting existing human, agricultural and industrial use. A frack operator’s water source management plan must adhere to these formal standards.

Sincerely, William Thomas Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires permit applicants to submit: a Water Source Management plan: “If fresh water is anticipated to be used in the high volume horizontal hydraulic fracturing treatment, a water source management plan that shall include the following information:” (source of ground or surface water, how much water to be used, months of use, methods to minimize fresh water use, methods used to minimize adverse impact to aquatic life). Problems with this section: While there is a required water management plan, this plan does not require application to local municipal, water district or other governmental control units requesting use of their ground or surface water resources. In fact, if fracking is allowed, local government has no authority to deny water to a frack well operator, even in the case of drought. There is no process for sharing the frack operator’s water plan with other state or regional agencies responsible for water usage (e.g. Illinois EPA, East Central IL Regional Water Supply Planning Committee) for their input on whether the plan is adequate, and how usage relates to possible drought situations. There are no minimum regulatory thresholds regarding the amount of water to be used, the impact of water use given drought situations, actual impact on aquatic life, impact on existing human, industrial and agricultural water immediate needs, and potential future impacts. Why these are problems: The IDNR report The Drought of 2012, March 2013 identified: In 2012, the 12 counties of southern IL--where the majority of fracking leases have been obtained--experienced “D4 drought – exceptional”, the most severe drought rating. In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Abby Dompke Chicago, IL 60607

Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Alen Makhmudov Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Benjamin Boyajian Chicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Curtis Morris Chicago, IL 60607

The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Eve Zuckerman CHicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Glen Edward Litchfield Darien, IL 60561

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Joanna Stauder Belleville, IL 62220

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Kathryn Chapman Hamburg, IL 62045

The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Kris Chatterjee Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, maayan olshan Chicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Mike Benz Chicago, IL 60645

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Rebecca Quesnell Chicago, IL 60605

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Scott Condren Chicago, IL 60608

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Ta Promlee Chicago, IL 60645

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Section 245.210 Permit Application Requirements

Section 245.210 requires that when "When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application." But the vast majority of fracking in Illinois is going to occur outside of municipalities; it will occur in areas where the local government unit is the county. The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Decatur, Carbondale, Marion, or other metro areas affected by the majority of fracking land leases. If permission is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? Solution: As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making and give counties and other local governmental decision-makers a say in whether fracking will be allowed in their communities and, if allowed, exactly how it will occur.

Sincerely, Westin Campo Chicago, IL 60608

Simply put this bill was put through by land owners who wanted to profit from fracking which I find to be a conflict of interest! I feel the counties have a right to be safe and excluding their rights is wrong. We need to keep these things away from schools...the kids deserve our protection. There are five counties that do not want fracking and yet they are being forced into this. The Governor has failed to protect the counties ...the Department of Health is not involved the sick must hire an attorney to find out from the States Attorney what trade chemical is injuring them...the whole process is corrupt! There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the resident themselves. AS the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that is better equipped or knowledgeable on the needs of residents living in Illinois counties....and when the Northern counties realize the threat of earth quake this will cause and nuke power plant collapses or cracks they will want this to change too.

There is no completely safe way for the IDNR nor any Illinois govt. agency to assure the safe practice of an inherently unsafe procedure as fracking. I nor any family member or friend i know in this state want fracking in Illinois, nor sand mining, meaning the permanent degradation of land that could be used for farming and food, tourism, native land restoration and other uses. We only have one earth, and a few jobs at what cost? Future generations succumbing to illness and death on dead land, poisoned land and water? The state needs to come up with better solutions for jobs and economy that do not poison our resources. The future is renewable resources and restoration of the land. The IDNR should be charged with protecting our resources, not allowing its destruction.

Sincerely, Tracy Kankakee, IL 60901

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

This section specifies that an application for a fracking well site must have official consent from municipal authorities of a city, village, or incorporated town. However, In much of Southeastern Illinois, where fracking is anticipated to take place, the residents live in unincorporated areas where the county is the most direct level of government. This provision needs revision to include county governments including those overseeing unincorporated residential areas, so that local residents will have some government supervision over fracking operations in their communities.

Sincerely, Ivy Czekanski 601 W. Deming Place #502 Chicago, IL 60614

Section 245.210 Permit Application Requirements

To the Illinois Department of Resources, After taking time to look over the proposed rules and regulations for hydraulic fracturing in Illinois I find the rules to be inadequate and quite frankly I find them to be a joke. To start things off, the Rules state "Published studies or reports, and sources of underlying data, used to compose this rulemaking: None". While in high school, and especially now as a college student pursuing a higher education, I write plenty of papers and I find this lack of studies and sources of underlying data to be quite distasteful. It is near finals week for me and I have several research papers that I am currently writing. These papers are a mere 8-10 pages each (versus the 135 page document for proposed rules composed by your department) and for each paper I have to use at least 6-8 sources. This is a paper we are talking about and though it is important to my learning and education to be writing it, it is not something as serious as hydraulic fracturing. I seriously question your department's competence, or lack thereof, with regards to this. If you are not going to consult science and cold hard facts (unbiased in the least) while drafting the rules, then hydraulic fracturing should not even be a question in Illinois: It should simply not be allowed because we are not adequately preparing for it or examining it. Though I understand that what you have proposed is just a draft, even drafts should have sources and consult the science behind this environmentally harmful and stressful process. The papers I mentioned that I am currently writing for a few finals require several steps. First, I have to choose a topic (this is easy for you since the topic of hydraulic fracturing has "been assigned" to you). Next, I have to brainstorm how I am going to go about writing my paper including: what points I want to convey, what side I am taking (if it is an argumentative paper), how I am going to convey the points I am making, etcetera. Then there is the outline: I have to structure my paper in an outline format, consider what sources I am going to use, and transition my paper between sections to allow a flow easy for the reader to follow. The first draft comes next. This is basically my whole paper, with perhaps a few improvements to be made along the way. Ultimately, it follows the format of my proposed outline and it includes all the sources I have collected and found appropriate to be implemented into my paper. Several drafts may occur until, finally, I find my paper to be adequate enough to be turned in and graded! Again, I understand that these proposed rules are just a draft, but it seems to me that it is a very insufficient first draft especially because it does not include "sources of underlying data, resources, etc". How can you hope to construct a document such as this without such sources? Everything you have proposed should be thrown out because it has not consulted studies. This is of course the main point I am making. However, the only reason that I can assume your rules and regulations are so ill prepared is that you must have preferred to get assigned the other side of this topic. You are proposing rules and regulations so that hydraulic fracturing can start taking place in Illinois, but perhaps it would have been easier for you to write about why it should not be coming to Illinois, I am sure you would have found plenty of sources on that! As for my demands: I demand that you continue making this inadequate document into an actual first draft, rather than procrastinate it and write it all in one night (is that why you could not collect sources, not enough time?). I also demand that you start representing the people

in this matter. There is obviously a lot of controversy with hydraulic fracturing coming to Illinois, aren't you asking yourselves why? Take a trip down to Southern Illinois, perhaps for a few days, and go without drinking water that whole time (to show how your groundwater could be contaminated from the process), imagine all of your belongings and your whole home crumbling before you as you experience the fourth earthquake of a 4.9 magnitude (and now the fracking site can be shut down for inducing those earthquakes…about an earthquake too late), and punch yourself in your nose (some of the associated health impacts to fracking include bloody noses, just ask those who have been affected) just for starters. This may seem like an unreasonable request…for me to be asking you to do such things, but I feel that until you personally experience the different effects of fracking you will only continue to cater and be under the grasp of big corporations and continue to make loopholes in the rules and regulations for those corporations, as has already been seen in what you have proposed. Thank you for your time and for reading this, and please PLEASE consider what I have put before you.

Sincerely, Anica Washington 7308 S Champlain Ave Chicago, IL 60619

Section 245.210 Permit Application Requirements

When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application. This is excellent for municipalities, but what about counties? The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Carbondale, Marion, Decatur or other metro areas affected by the majority of fracking land leases. If prior notification and an intentional process of permitting is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties?

Sincerely, Adriana Caballero Oak Park, IL 60302

However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties?

Sincerely, Garrick Balk 236 Prairie Street South Elgin, IL 60177-1528

Section 245.210 Permit Application Requirements

When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application. This is excellent for municipalities, but what about counties? The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Carbondale, Marion, Decatur or other metro areas affected by the majority of fracking land leases. If prior notification and an intentional process of permitting is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. Section 245.210 Permit Application Requirements

When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application. This is excellent for municipalities, but what about counties? The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Carbondale, Marion, Decatur or other metro areas affected by the majority of fracking land leases. If prior notification and an intentional process of permitting is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. It is imperative that the oversight and permission rights for fracking be available to county residents and governments, not only to municipalities.

Sincerely, Norma Claire Moruzzi Chicago, IL 60640

As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties? In addition, this body should note that the Pennsylvania Supreme Court just struck down as unconstitutional the rule (in Pa.) which gives states the authority to preempt counties from regulating fracking within their jurisdiction. The Illinois Appellate Court in the Fifth District has set a similar precedent for local control over basic zoning in the City of Carlyle case. The regulations must recognize the common sense principles that Counties and unincorporated towns should have some ability to regulate such things as setbacks from churches, schools, daycare, elder care, homes, water supplies, and public parks.

Little if any fracking is anticipated within the cities of Carbondale, Marion, Decatur or other metro areas affected by the majority of fracking land leases. If prior notification and an intentional process of permitting is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? There is no substantive difference between a municipal or county government in Illinois in its powers other than the issue of Illinois Constitutional Home Rule. However, the lack of county Home Rule has never preempted a county power to issue permits on mineral or oil extraction. Numerous county governments have long histories and traditions in the permitting process regarding mineral and drilling industries. As the current fracking law is largely silent on the issue of county control, IDNR rules should err on the side of history and citizen decision-making. Counties and municipalities of government tax, employ law enforcement, provide social services and infrastructure. The rules provide no explanation why citizens residing in counties of Illinois should have less input regarding fracking permits. The regulatory differentiation between the rights of residents in municipalities vs. counties creates a group of second class citizens. These second class citizens have fewer rights in their ability to participate and ultimately determine the type and quality of energy extraction allowed in their neighborhoods. There is no reasonable expectation that the personnel at IDNR have any better or more clear understanding of the will of citizens in counties regarding fracking permits than the residents themselves. As the proposed IDNR rules envision municipalities empowered to decide fracking sites, what possible argument does IDNR have that it is better equipped or knowledgeable on the needs of residents living in Illinois counties?

Sincerely, Sloane Moore River Forest, IL 60305

In reference to Subpart B: Registration and Permitting Procedures

Section 245.210 Permit Application Requirements

When an application is made to frack a well site located within the limits of any city, village or incorporated town, the application shall state the name of the city, village, or incorporated town and be accompanied with a certified copy of the official consent for the high volume horizontal hydraulic fracturing operations to occur from the municipal authorities where the well site is proposed to be located. No permit shall be issued unless consent is secured and filed with the permit application. This is excellent for municipalities, but what about counties? The intent of the legislation was to recognize that local units of government should have decision-making power regarding whether to allow fracking in their jurisdictions. This section demonstrates blatant disregard for the realities of the geography of fracking in Illinois regarding cities compared to counties. Little if any fracking is anticipated within the cities of Carbondale, Marion, Decatur or other metro areas affected by the majority of fracking land leases. If prior notification and an intentional process of permitting is important for metropolitan communities, why are the proposed rules silent regarding neighborhoods in counties and the families living there? In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 should be revised to raise bonding requirements to levels that sufficiently protect the public against potential damages in the event of an accident or operator default. Each well site should be independently bonded.

Sincerely, Lan R. Richart 1645 W. Jarvis Avenue Chicago, IL 60626

In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Abby Dompke Chicago, IL 60607

One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Benjamin Boyajian Chicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, E Zemin Champaign, IL 61821

In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site.
