Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, David Klawitter Chicago, IL 60607

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Elias Friedman Chicago, IL 60605

But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Eve Zuckerman CHicago, IL 60615

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, James Alstrum Normal, IL 61761

While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Jessica Green Chicago, IL 60637

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Johnathan Guy Chicago, IL 60637

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Kiehlor Mack Chicago, IL 60637

While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Liza Pono Chicago, IL 60616

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Mansi Kathuria Chicago, IL 60647

But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Natalya Glaser Chicago, IL 60637

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Olivia Stovicek Chicago, IL 60637

But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Peter Dompke Belleville, IL 62221

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Rebecca Foster Chicago, IL 60615

While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Roberta Weiner Chicago, IL 60637

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Sam Vexler Chicago, IL 60637

But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Shaden Amara Naperville, IL 60564

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Tim Law 5625 S. Ellis Ave Chicago, IL 60637

While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Will Fernandez Chicago, IL 60615

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Zaid Mctabi Chicago, IL 60605

Section 245.330 Permit Modifications

Subsection 245.330(b)(1) states, “Sections of a permit modification application that are not the subject of a proposed deviation from an original permit are not required to be completed.” It is entirely possible that a potential significant impact of a modification would not be the “subject of” the modification but rather a consequence of it and those portions of a permit modification should be required to be completed. Revisions Needed: This language in this section should be modified to state that sections “that are not impacted by” the proposed modifications need not be completed.

Section 245.330 Permit Modifications

Subsection 245.330(b)(1) states, “Sections of a permit modification application that are not the subject of a proposed deviation from an original permit are not required to be completed.” It is entirely possible that a potential significant impact of a modification would not be the “subject of” the modification but rather a consequence of it and those portions of a permit modification should be required to be completed. Revisions Needed: This language in this section should be modified to state that sections “that are not impacted by” the proposed modifications need not be completed.

Sincerely, Ashley Seymour Chicago, IL 60615

Section 245.330 Permit Modifications

Subsection 245.330(b)(1) states, “Sections of a permit modification application that are not the subject of a proposed deviation from an original permit are not required to be completed.” It is entirely possible that a potential significant impact of a modification would not be the “subject of” the modification but rather a consequence of it and those portions of a permit modification should be required to be completed. Revisions Needed: This language in this section should be modified to state that sections “that are not impacted by” the proposed modifications need not be completed.

Sincerely, David Zask NY, IL 10128

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Subsection 245.330(b)(1) states, “Sections of a permit modification application that are not the subject of a proposed deviation from an original permit are not required to be completed.” It is entirely possible that a potential significant impact of a modification would not be the “subject of” the modification but rather a consequence of it and those portions of a permit modification should be required to be completed. Revisions Needed: This language in this section should be modified to state that sections “that are not impacted by” the proposed modifications need not be completed.

Sincerely, Girwana Baker Chicago, IL 60605

Section 245.330 Permit Modifications

Subsection 245.330(b)(1) states, “Sections of a permit modification application that are not the subject of a proposed deviation from an original permit are not required to be completed.” It is entirely possible that a potential significant impact of a modification would not be the “subject of” the modification but rather a consequence of it and those portions of a permit modification should be required to be completed. Revisions Needed: This language in this section should be modified to state that sections “that are not impacted by” the proposed modifications need not be completed.

Sincerely, Lauren San Juan Chicago, IL 60608

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Subsection 245.330(b)(1) states, “Sections of a permit modification application that are not the subject of a proposed deviation from an original permit are not required to be completed.” It is entirely possible that a potential significant impact of a modification would not be the “subject of” the modification but rather a consequence of it and those portions of a permit modification should be required to be completed. Revisions Needed: This language in this section should be modified to state that sections “that are not impacted by” the proposed modifications need not be completed.

Sincerely, Navroz Tharani Chicago, IL 60615

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Subsection 245.330(b)(1) states, “Sections of a permit modification application that are not the subject of a proposed deviation from an original permit are not required to be completed.” It is entirely possible that a potential significant impact of a modification would not be the “subject of” the modification but rather a consequence of it and those portions of a permit modification should be required to be completed. Revisions Needed: This language in this section should be modified to state that sections “that are not impacted by” the proposed modifications need not be completed.

Sincerely, Rebecca McBride Mahomet, IL 61875

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Subsection 245.330(b)(1) states, “Sections of a permit modification application that are not the subject of a proposed deviation from an original permit are not required to be completed.” It is entirely possible that a potential significant impact of a modification would not be the “subject of” the modification but rather a consequence of it and those portions of a permit modification should be required to be completed. Revisions Needed: This language in this section should be modified to state that sections “that are not impacted by” the proposed modifications need not be completed.

Sincerely, Scott Condren Chicago, IL 60608

Section 245.330 Permit Modifications

Subsection 245.330(b)(1) states, “Sections of a permit modification application that are not the subject of a proposed deviation from an original permit are not required to be completed.” It is entirely possible that a potential significant impact of a modification would not be the “subject of” the modification but rather a consequence of it and those portions of a permit modification should be required to be completed. Revisions Needed: This language in this section should be modified to state that sections “that are not impacted by” the proposed modifications need not be completed.

Sincerely, Yvette McGivern Chicago, IL 60637

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

Dear IDNR, Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil. Kurt

Illinois has become the poster child for how NOT to produce energy safely. - Illinois' marriage to old coal-fired power plants as the single largest source of industrial air pollution, has cut short thousands of Illinois lives and sickened many thousands. Campaign contributions by Midwest Generation and others ensured unconscionable delays in providing the scrubber technology that would have reduced these numbers. - Illinois leads the country in the number of nuclear reactors; with four of the same model that blew in Fukushima. Cancers plague the communities in which reactors are located - witness Braidwood. Tritium leaks and other releases are commonplace. Campaign contributions by Exelon to our elected officials are also commonplace - ensuring the continuation of inadequate enforcement, lack of improvements, and automatic of renewal of licenses of old and dangerous plants to poison for decades more. Stockpiles of Illinois' nuclear waste threatens the health and safety of its residents. - No surprise that Illinois' elected officials are now embracing fracking - WITHOUT ADEQUATE STUDY, REFLECTION - AND WITH DISREGARD FOR DISTURBING FRACKING DISASTERS EXPERIENCED IN OTHER STATES. PROMINENTLY MAKE PUBLIC ALL CAMPAIGN DONATIONS AND CONTRIBUTIONS TO OUR ELECTED OFFICIALS BY ANY PERSON OR COMPANY INVOLVED IN THE FRACKING INDUSTRY. NO BACKDOOR DEALS, NO SIDEDOOR DEALS. ILLINOIS RESIDENTS PAY DEARLY FOR THE MISTAKES AND ENRICHMENT OF ILLINOIS POLITICIANS! WE DESERVE BETTER!

Living in Chicago, its been a blessing having easy access to water. Being so close to Lake Michigan really made me appreciate the important part water plays in our lives. How we need it to survive and grow just like plants and animals do. Fracking threatens this very essential source of life. It is dangerous to the health of the planet and of the people on it. Cancer and earthquakes should not be the consequences of independent energy. I understand the benefits of fracking for natural gas but, the casualties current and future are insurmountable when deducing the risks and rewards. Hydraulic Fracking endangers municipal water source, stability of land, health of crops, and people. It releases large amounts of toxic chemical found in the fracking fluid to the environment and contains it in insufficient, dangerous, and unregulated pools. Evaporating into the air that everyone breaths may seem like a small cost but unless you are willing to switch places and live in these places where the fracking is occurring, you have no right to make the rules that don't effect you personally but benefit your pockets. I'm not trying to attack you or tell you how to do your job. We have all heard the term to treat others the way you wish to be treated. So protect us like you protect what you hold dearly, whether it be your home, friends, family, or children, because we are all out here trying to protect ours. Southern Illinois deserves better, America deserves better that sacrificing one person for one resource. Resources as we call them in reality aren't even resources, they are gifts, things we usually never get back. So please try harder to regulate and enforce justice in this situation because the natural gas you extract isn't worth the years cut of peoples lives, the fear, the danger, and the helplessness of loving where you live and where you grew up, and having to leave this place because it made you sick, because your water is flammable, because your crops are dead, and because others care more about money than people. Please choose people.

Sincerely, Lupita Carrasquillo 2423 N. Newcastle Ave (1) Chicago, IL 60707

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

No one likes a roommate who eats all the food in the apartment and never replaces it. It would be even worse if, say, I rented your apartment and got rid of all of your furniture because I was going to stay more than a year. Then, as I moved out, I replaced a couple of pieces of the furniture to your exact specification, but left the majority of the apartment empty. You might get mad and ask, "How is someone supposed to live in an apartment with a couple of chairs and no bed?" Similarly, someone might be angry if an enormous well--like the one featured in this article about the thousands of abandoned Wyoming wells--were left unplugged and devoid of topsoil in their backyard. (http://www.nytimes.com/2013/12/25/us/state-may-act-to-plug-abandoned-wyoming-wells-asnatural-gas-boom-ends.html?_r=0) The General Assembly wrote the hydraulic fracturing regulatory act so that top soil would have to be returned to well sites. Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its pre-drilling condition: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” (Section 1-95(c)) IDNR's rules more or less adhere to the Act in instances where drilling is anticipated to be completed in less than a year, stipulating that the topsoil is to stockpiled and stabilized to prevent erosion (Section 245.410(d)). However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." While characteristics of the soil are indeed important--as in the characteristics of the furniture in my fictitious apartment--volume also matters. However, the rules do not require measurement of the soil removed to ensure that a similar quantity of soil is also used to fill the well. This is problematic because, like your partially furnished apartment, a well could be left partially filled. When final reclamation is anticipated to exceed one year, Section 245.410(d) must require that the fracking operator measure the volume of removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Alonzo Cummins Chicago, IL 60612

In reference to Subpart D: Well Site Preparation

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Ammar Kalimullah Chicago, IL 60637

In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Brian Menzel Chicago, IL 60608

In reference to Subpart D: Well Site Preparation

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Emerson Delgado Chicago, IL 60637

In reference to Subpart D: Well Site Preparation

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Jan A Pietrzak 12031 S 72nd Ct Palos Heights, IL 60463

In reference to Subpart D: Well Site Preparation

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Katie Lettie Chicago, IL 60637

In reference to Subpart D: Well Site Preparation

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, maayan olshan Chicago, IL 60615

Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Nancy Penney Monticello, IL 61856

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Paulo Nacimiento Chicago, IL 60637

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Sarah Quesnell Chicago, IL 60605

In reference to Subpart D: Well Site Preparation

Section 245.410 Access Roads, Public Roads and Topsoil Conditions

Sections 1-70(b)2 and 1-95(c) of the Hydraulic Fracturing Regulatory Act state that stripped topsoil is to be replaced with similar soil and the site returned to its predrilling condition. Section 1-95(c) of the Act specifically states: “The operator shall restore any lands used by the operator other than the well site and production facility to a condition as closely approximating the pre-drilling conditions that existed before the land was disturbed for any stage of site preparation activities, drilling, and high volume horizontal hydraulic fracturing operations.” When drilling is anticipated to be completed in less than a year, Section 245.410(d) of the Rules stipulates that the topsoil is to stockpiled and stabilized to prevent erosion. However, “In the event it is anticipated that the final reclamation shall take place in excess of one year from drilling the well, the topsoil may be disposed of in any lawful manner provided the permittee reclaims the site with topsoil of similar characteristics of the topsoil removed." What is missing, and needed, in this section of the Rules is the stipulation that the replacement topsoil will be not only similar in characteristics of the topsoil removed, but also match the removed topsoil in VOLUME. In fact, there is no place in the rules that requires measurement of the topsoil removed or measurement of the replacement topsoil. Without such a requirement, it would be easy for an unscrupulous operator to replace the topsoil with smaller quantities than were originally removed. Revisions Needed: When final reclamation is anticipated to exceed one year and topsoil is removed from the site, Section 245.410(d) must require measuring the volume of the removed topsoil and stipulate that the replacement topsoil will match both the quality AND quantity of the removed topsoil.

Sincerely, Tori Root Naperville, IL 60564

In reference to Subpart F: Water Quality

Section 245.600 Water Quality Monitoring

According to the miles-to-feet converter I found on Google, there are 5280 feet in a mile. So it stands to reason that there are up to 10,560 feet along the length of the horizontal well bore. There is significant evidence of the possibility of surface and groundwater contamination from fracking operations. So why are we not requiring testing along the length of the horizontal well bore? This is a serious oversight that must absolutely be remedied. Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.)

Sincerely, Ken Buck Naperville, IL 60540

According to the miles-to-feet converter I found on Google, there are 5280 feet in a mile. So it stands to reason that there are up to 10,560 feet along the length of the horizontal well bore. There is significant evidence of the possibility of surface and groundwater contamination from fracking operations. So why are we not requiring testing along the length of the horizontal well bore? This is a serious oversight that must absolutely be remedied. Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores.

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Ammar Kalimullah Chicago, IL 60637

In reference to Subpart F: Water Quality

Section 245.600 Water Quality Monitoring

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Brian Menzel Chicago, IL 60608

In reference to Subpart F: Water Quality

Section 245.600 Water Quality Monitoring

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Curtis Morris Chicago, IL 60607

The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.)

Sincerely, Elizabeth A. Cerny 7728 Williams St. Downers Grove, IL 60516

In reference to Subpart F: Water Quality

Section 245.600 Water Quality Monitoring

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.)

Sincerely, Elizabeth Patula Makanda, IL 62958

In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Hannah Kershner Galena, IL 61036

In reference to Subpart F: Water Quality

Section 245.600 Water Quality Monitoring

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.)

Sincerely, joann conrad 13 red oak lane springfield, IL 62712

Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Kiehlor Mack Chicago, IL 60637

In reference to Subpart F: Water Quality

Section 245.600 Water Quality Monitoring

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". Section 245.600 Water Quality Monitoring

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.)

Sincerely, Mary Mathews Lake Forest, IL 60045

Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Noah Hellermann New York, IL 11218

In reference to Subpart F: Water Quality

Section 245.600 Water Quality Monitoring

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Rachael Dompke Belleville, IL 62221

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Sarah Quesnell Chicago, IL 60605

Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Stanley Archacki Westmont, IL 60559

In reference to Subpart F: Water Quality

Section 245.600 Water Quality Monitoring

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In reference to Subpart F: Water Quality

Section 245.600 Water Quality Monitoring

Section 245.600(b)(1) of the proposed rules provides for the testing and monitoring of water sources within 1,500 feet of the well site. Among the many problems with the monitoring provisions, the proposed rules do not provide for testing along the horizontal leg of the well bore, which can extend for up to two miles from the well site. This is a reckless disregard of the known risk of the underground migration of toxic fluids from a horizontal well bore, especially when hydraulic fracturing involves the use of explosive charges and especially in areas known for the risk of higher-magnitude earthquakes. In a report issued on September 5, 2012, the U.S. Government Accountability Office acknowledged this risk: Oil and gas development, whether conventional or shale oil and gas, pose inherent environmental and public health risks, but the extent of these risks associated with shale oil and gas development is unknown, in part, because the studies GAO reviewed do not generally take into account the potential long-term, cumulative effects." --From: Information on Shale Resources, Development, and Environmental and Public Health Risks, U.S. Government Accountability Office, GAO-12-732 (2012), "What GAO Found". The agency mentioned specifically the risk of underground migration of toxic gases and chemicals: "[A] number of studies and publications GAO reviewed indicate that shale oil and gas development poses risks to water quality from contamination of surface water and groundwater as a result of erosion from ground disturbances, spills and releases of chemicals and other fluids, or underground migration of gases and chemicals." (Emphasis added.) Water testing and monitoring should be required all along the length of any horizontal well bores. (The Government Accountability Office is an independent, nonpartisan agency that works for Congress.) Solution: Water testing should be required not only within a 1500 feet radius of the well site but also within 1500 feet around any point of any horizontal well bore.

Sincerely, Westin Campo chicago, IL 60608

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to current list of indicator chemicals in the proposed regulations but will include all chemicals used in the fracturing process.

Sincerely, Eileen Sutter 4125 North Monticello Chicago, IL 60618

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Determining if water pollution has occurred How does this affect me: Water Integrity Relevant parts of the Proposed Administrative Rules: Subpart F: Water Quality (245.600-245.630) 245.620 Rebuttable Presumption of Pollution or Diminution Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process.

Sincerely, Stephanie Bilenko LaGrange Park, IL 60526

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

I am writing as a student terrified of a future of climate catastrophe. These rules indicate a lack of attention to basic protections for the health and safety of Illinois residents. There are an overwhelming number of holes in these rules, and so many of them put our health at risk. Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process.

Sincerely, Dylan Amlin 4750 N Sheridan Chicago, IL 606040

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

I am writing as a student terrified of a future of climate catastrophe. These rules indicate a lack of attention to basic protections for the health and safety of Illinois residents. There are an overwhelming number of holes in these rules, and so many of them put our health at risk. Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process.

Sincerely, Dylan Amlin 4750 N Sheridan Chicago, IL 606040

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

If it is IDNR's duty "To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment," why would IDNR horizontal fracking rules undercut the law regarding Water Quality Monitoring? If the act governing water quality monitoring does not limit the number of chemicals that would indicate water contamination, and over 700 chemicals are used in fracking, why would IDNR limit the number of testable chemicals to the chemicals listed in the Act governing Water Quality Monitoring? The list provided in the act are _indicators_ of water contamination, and the list is not meant to be comprehensive, so why did IDNR write the rules as if the list is comprehensive? Fracking operators should be held responsible for any pollution or diminution in water quality caused by the fracking process. The IDNR fracking rules should require water testing for all chemicals used in the fracturing process, and not just a list of indicator chemicals.

Sincerely, Sara Buck Chicago, IL 60640

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

It concerns me that although there are around 700 chemicals that can contaminate our water supply, only a portion of those chemicals can be used as an indicator for contamination. Logically, it should require that if any chemical that the fracking operator is using is found in the water supply, especially ones which do not correspond to other operations in the area, would be an indicator of contamination. This is extremely important to me because of the safety of drinking water in the area. Also, the waterways are important ecological zones for those who engage in fishing and other recreational activities involved in Illinois. It could cause property values to drop, especially properties with wells, and could endanger recreational areas that families frequent. Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Section 1-85(a) states that it "establishes a rebuttable presumption for the purposes of evidence and liability under State law regarding claims of pollution or diminution of a water source and for use regarding the investigation and order authority under Section 1- 83" (emphasis added). The "and" is disjunctive, such that claims for pollution and diminution are not tied to or contingent on the investigation and order authority under section 1-83. Regardless, nothing in section 1-83 limits investigation and order authority to the constituents tested for under section 1-80; on the contrary, that section expressly references "pollution or diminution," which as discussed above is broadly defined with reference to the Illinois Administrative Code. See section 1-83(a) ("Any person who has reason to believe they have incurred pollution or diminution of a water source as a result of high volume hydraulic fracturing treatment of a well may notify the Department and request that an investigation be conducted") (emphasis added) and 1-83(d) ("if sampling results or other information obtained as part of the investigation or the results of tests conducted under subsection (c) of Section 1-80 of this Act indicate [pollution or diminution violations], the Department shall issue an order…") (emphasis added). In sum, it is clear hat section 85 of the Act creates a presumption of liability for all constituents contained in the Act's definition of "pollution or diminution," not solely for the constituents tested for under section 1-80. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process. Furthermore a number of provisions in the draft rules nonetheless inappropriately purport to limit evidence triggering the presumption to the section 1-80 sampling results. The particular provisions of concern are as follows: a. 245.620(b)(2) – the word "the" before "baseline water quality data" should be stricken to make clear that any baseline water quality data, not just the data collected pursuant to the

Act's requirements, may trigger the presumption. b. 245.620(b)(4) – this section should preferably be amended to mirror subparagraph (b)(2) (amended per above recommendation), i.e., state that "water quality data obtained up to 30 months after commencement of HVHHF operations shows that pollution or diminution of water quality has occurred with respect to one or more parameters" set forth in the relevant section of the Environmental Protection Act regulations referenced at 245.610(e). c. 245.620(c)(4) – this section is superfluous, as well as confusing for the reason specified below. If the water quality data (broadly defined per above) do not show pollution or diminution, then there is no presumption to rebut. The relevant concept from the statute that should be reflected here, and is not, is from subsection 1-85(c)(3), specifying that the presumption can be rebutted if it can be affirmatively established that the pollution or diminution had an identifiable cause other than HVHHF operations. To illustrate how severely the Department's unauthorized limitation of section 1-85 of the Act has curtailed its scope, we offer the following list of chemicals that are covered by the statutory definition of "pollution or diminution" that should therefore also be subject to the presumption according to the plain language of section 1-85. Shown capitalized are the few constituents that remain subject to the presumption under the Department's truncated interpretation: • Detection of any: BENZENE, any other carcinogen • Preventive Response Criteria at 35 IAC 620.310(a)(3)(A)(i): para-dichlorobenzene, ortho-dichlorobenzene, methyl tertiary butyl ether (MTBE), phenols, styrene, TOLUENE, ETHYLBENZENE, XYLENES, • 35 IAC 620.410: (a) antimony, ARSENIC, BARIUM, beryllium, CADMIUM, CHLORIDE, CHROMIUM, cobalt, copper, cyanide, fluoride, IRON, LEAD, MANGANESE, MERCURY, nickel, nitrate as n, perchlorate, Radium-226, Radium-228, SELENIUM, SILVER, SULFATE, thallium, TDS, vanadium, zinc; (b) Acenaphthene, Acetone, Alachlor*, Aldicarb, Anthracene, Atrazine, Benzene [repeat], Benzo(a)anthracene*, Benzo(b)flouranthene*, Benzo(k)floranthene*, Benzo(a)pyrene*, Benzoic acid, 2-Butanone (MEK), Carbofuran, Carbon Disulfide, Carbon Tetrachloride, Chlordane*, Chloroform*, Chrysene*, Dalapon, Dibenzo(a,h) anthracene*, Dicamba, Dichlorodiflouromethane; 1,1-Dichloroethane, Dichloromethane*, Di(2- ethylhexyl)phthalate*, Diethyl Phthalate, Di-n-butyl Phthalate, Dinoseb, Endothall, Endrin, Ethylene Dibromide*, Flouranthene, Flourene, Heptachlor*, Heptachlor Epoxide*, Hexachlorocyclopentadiene, Indeno(1,2,3-cd)pyrene*, Isopropylbenzene (Cumene), Lindane (Gamma-Haxachlorocyclohexane), 2,4-D, ortho-Dichlorobenzene, para-Dichlorobenzene; 1,2- Dibromo-3-Chloropropane*; 1,2-Dichloroethane*, 1,1 Dichloroethylene, cis-1,2- Dichloroethylene, trans-1,2-Dichloroethylene, 1,2-Dichloropropane*, Ethylbenzene, MCPP (Mecoprop), Methoxychlor, 2-Methylnaphthalene, 2-Methylphenol, Methyl Tertiary-Butyl Ether (MTBE), Monochlorobenzene, Naphthalene, P-Dioxane*, Pentachlorophenol*, Phenols, Picloram, Pyrene, Poly-chlorinated Biphenyls (PCBs) (as decachloro-biphenyl)*, alpha-BHC (alpha- Benzene hexachloride)*, Simazine, Styrene, 2,4,5-TP (Silvex), Tetrachloroethylene*, Toluene, Toxaphene*, 1,1,1-Trichloroethane; 1,1,2-Trichloroethane; 1,2,4- Trichlorobenzene; Trichloroethylene*; Trichlorofluoromethane; Vinyl Chloride*, Xylenes; (c) 1,3-Dinitrobenzene, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, HMX (High Melting Explosive, Octogen); Nitrobenzene; RDX (Royal Demolition Explosive, Cyclonite), 1,3,5- Trinitrobenzene; 2,4,6- Trinitrotoluene (TNT); (d) [repeats]; (e) PH. • Chemicals with 35 IAC 720 Groundwater Cleanup Objectives (not already listed above): Aldrin, Bis(2-chloroethyl)ether, Bis(2-ethylhexyl)phthalate (Di(2- ethylhexyl)phthalate), DDD, DDE, DDT, 1,2-Dibromoethane, 3,3'-Dichlorobenzidine, Dieldrin, Hexachlorobenzene, Alpha-HCH,

N-Nitrosodi-n-propylamine, 2,4,6-Trichlorophenol, Bromodichloromethane (Dichlorobromomethane), Bromoform, Butanol, butyl benzyl phthalate, carbazole, 4-Chloroaniline (r-Chloroaniline), Chlorobenzene (Monochlorobenzene), Chlorodibromomethane (Dibromochloromethane), 2-Chlorophenol (pH 4.9-7.3), 2-Chlorophenol (pH 7.4-8.0), 1,1-Dichloroethane, 2,4-Dichlorophenol, 1,2-Dichloropropane; 1,3-Dichloropropene (1,3-Dichloropropylene, cis + trans); Diethyl phthalate; 2,4- Dimethylphenol; 2,4-Dinitrophenol; Di-n-octyl phthalate; Endosulfan, Hexachloroethane, Isophorone; Methyl bromide (Bromomethane); Methyl tertiary-butyl ether; Methylene chloride (Dichloromethane); 2-Methylphenol (o-Cresol); N-Nitrosodiphenylamine; N-Nitrosodi-npropylamine; Pentachlorophenol; 2,4,5-Trichlorophenol (pH 4.9-7.8); 2,4,5-Trichlorophenol (pH 7.9-8.0); 2,4,6-Trichlorophenol (pH 4.9-6.8); 2,4,6-Trichlorophenol (pH 6.9-8.0); Vinyl acetate; Boron, CALCIUM; Chromium, ion, hexavalent; MAGNESIUM, phosphorus, potassium, sodium. We note that this concern is not by any means academic: at least some of these excluded constituents are found on FracFocus, indicating that they have been used in fracking operations.

Sincerely, Abby Dompke Chicago, IL 60607

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Section 1-85(a) states that it "establishes a rebuttable presumption for the purposes of evidence and liability under State law regarding claims of pollution or diminution of a water source and for use regarding the investigation and order authority under Section 1- 83" (emphasis added). The "and" is disjunctive, such that claims for pollution and diminution are not tied to or contingent on the investigation and order authority under section 1-83. Regardless, nothing in section 1-83 limits investigation and order authority to the constituents tested for under section 1-80; on the contrary, that section expressly references "pollution or diminution," which as discussed above is broadly defined with reference to the Illinois Administrative Code. See section 1-83(a) ("Any person who has reason to believe they have incurred pollution or diminution of a water source as a result of high volume hydraulic fracturing treatment of a well may notify the Department and request that an investigation be conducted") (emphasis added) and 1-83(d) ("if sampling results or other information obtained as part of the investigation or the results of tests conducted under subsection (c) of Section 1-80 of this Act indicate [pollution or diminution violations], the Department shall issue an order…") (emphasis added). In sum, it is clear hat section 85 of the Act creates a presumption of liability for all constituents contained in the Act's definition of "pollution or diminution," not solely for the constituents tested for under section 1-80. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process. Furthermore a number of provisions in the draft rules nonetheless inappropriately purport to limit evidence triggering the presumption to the section 1-80 sampling results. The particular provisions of concern are as follows: a. 245.620(b)(2) – the word "the" before "baseline water quality data" should be stricken to make clear that any baseline water quality data, not just the data collected pursuant to the

Act's requirements, may trigger the presumption. b. 245.620(b)(4) – this section should preferably be amended to mirror subparagraph (b)(2) (amended per above recommendation), i.e., state that "water quality data obtained up to 30 months after commencement of HVHHF operations shows that pollution or diminution of water quality has occurred with respect to one or more parameters" set forth in the relevant section of the Environmental Protection Act regulations referenced at 245.610(e). c. 245.620(c)(4) – this section is superfluous, as well as confusing for the reason specified below. If the water quality data (broadly defined per above) do not show pollution or diminution, then there is no presumption to rebut. The relevant concept from the statute that should be reflected here, and is not, is from subsection 1-85(c)(3), specifying that the presumption can be rebutted if it can be affirmatively established that the pollution or diminution had an identifiable cause other than HVHHF operations. To illustrate how severely the Department's unauthorized limitation of section 1-85 of the Act has curtailed its scope, we offer the following list of chemicals that are covered by the statutory definition of "pollution or diminution" that should therefore also be subject to the presumption according to the plain language of section 1-85. Shown capitalized are the few constituents that remain subject to the presumption under the Department's truncated interpretation: • Detection of any: BENZENE, any other carcinogen • Preventive Response Criteria at 35 IAC 620.310(a)(3)(A)(i): para-dichlorobenzene, ortho-dichlorobenzene, methyl tertiary butyl ether (MTBE), phenols, styrene, TOLUENE, ETHYLBENZENE, XYLENES, • 35 IAC 620.410: (a) antimony, ARSENIC, BARIUM, beryllium, CADMIUM, CHLORIDE, CHROMIUM, cobalt, copper, cyanide, fluoride, IRON, LEAD, MANGANESE, MERCURY, nickel, nitrate as n, perchlorate, Radium-226, Radium-228, SELENIUM, SILVER, SULFATE, thallium, TDS, vanadium, zinc; (b) Acenaphthene, Acetone, Alachlor*, Aldicarb, Anthracene, Atrazine, Benzene [repeat], Benzo(a)anthracene*, Benzo(b)flouranthene*, Benzo(k)floranthene*, Benzo(a)pyrene*, Benzoic acid, 2-Butanone (MEK), Carbofuran, Carbon Disulfide, Carbon Tetrachloride, Chlordane*, Chloroform*, Chrysene*, Dalapon, Dibenzo(a,h) anthracene*, Dicamba, Dichlorodiflouromethane; 1,1-Dichloroethane, Dichloromethane*, Di(2- ethylhexyl)phthalate*, Diethyl Phthalate, Di-n-butyl Phthalate, Dinoseb, Endothall, Endrin, Ethylene Dibromide*, Flouranthene, Flourene, Heptachlor*, Heptachlor Epoxide*, Hexachlorocyclopentadiene, Indeno(1,2,3-cd)pyrene*, Isopropylbenzene (Cumene), Lindane (Gamma-Haxachlorocyclohexane), 2,4-D, ortho-Dichlorobenzene, para-Dichlorobenzene; 1,2- Dibromo-3-Chloropropane*; 1,2-Dichloroethane*, 1,1 Dichloroethylene, cis-1,2- Dichloroethylene, trans-1,2-Dichloroethylene, 1,2-Dichloropropane*, Ethylbenzene, MCPP (Mecoprop), Methoxychlor, 2-Methylnaphthalene, 2-Methylphenol, Methyl Tertiary-Butyl Ether (MTBE), Monochlorobenzene, Naphthalene, P-Dioxane*, Pentachlorophenol*, Phenols, Picloram, Pyrene, Poly-chlorinated Biphenyls (PCBs) (as decachloro-biphenyl)*, alpha-BHC (alpha- Benzene hexachloride)*, Simazine, Styrene, 2,4,5-TP (Silvex), Tetrachloroethylene*, Toluene, Toxaphene*, 1,1,1-Trichloroethane; 1,1,2-Trichloroethane; 1,2,4- Trichlorobenzene; Trichloroethylene*; Trichlorofluoromethane; Vinyl Chloride*, Xylenes; (c) 1,3-Dinitrobenzene, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, HMX (High Melting Explosive, Octogen); Nitrobenzene; RDX (Royal Demolition Explosive, Cyclonite), 1,3,5- Trinitrobenzene; 2,4,6- Trinitrotoluene (TNT); (d) [repeats]; (e) PH. • Chemicals with 35 IAC 720 Groundwater Cleanup Objectives (not already listed above): Aldrin, Bis(2-chloroethyl)ether, Bis(2-ethylhexyl)phthalate (Di(2- ethylhexyl)phthalate), DDD, DDE, DDT, 1,2-Dibromoethane, 3,3'-Dichlorobenzidine, Dieldrin, Hexachlorobenzene, Alpha-HCH,

N-Nitrosodi-n-propylamine, 2,4,6-Trichlorophenol, Bromodichloromethane (Dichlorobromomethane), Bromoform, Butanol, butyl benzyl phthalate, carbazole, 4-Chloroaniline (r-Chloroaniline), Chlorobenzene (Monochlorobenzene), Chlorodibromomethane (Dibromochloromethane), 2-Chlorophenol (pH 4.9-7.3), 2-Chlorophenol (pH 7.4-8.0), 1,1-Dichloroethane, 2,4-Dichlorophenol, 1,2-Dichloropropane; 1,3-Dichloropropene (1,3-Dichloropropylene, cis + trans); Diethyl phthalate; 2,4- Dimethylphenol; 2,4-Dinitrophenol; Di-n-octyl phthalate; Endosulfan, Hexachloroethane, Isophorone; Methyl bromide (Bromomethane); Methyl tertiary-butyl ether; Methylene chloride (Dichloromethane); 2-Methylphenol (o-Cresol); N-Nitrosodiphenylamine; N-Nitrosodi-npropylamine; Pentachlorophenol; 2,4,5-Trichlorophenol (pH 4.9-7.8); 2,4,5-Trichlorophenol (pH 7.9-8.0); 2,4,6-Trichlorophenol (pH 4.9-6.8); 2,4,6-Trichlorophenol (pH 6.9-8.0); Vinyl acetate; Boron, CALCIUM; Chromium, ion, hexavalent; MAGNESIUM, phosphorus, potassium, sodium. In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Section 1-85(a) states that it "establishes a rebuttable presumption for the purposes of evidence and liability under State law regarding claims of pollution or diminution of a water source and for use regarding the investigation and order authority under Section 1- 83" (emphasis added). The "and" is disjunctive, such that claims for pollution and diminution are not tied to or contingent on the investigation and order authority under section 1-83. Regardless, nothing in section 1-83 limits investigation and order authority to the constituents tested for under section 1-80; on the contrary, that section expressly references "pollution or diminution," which as discussed above is broadly defined with reference to the Illinois Administrative Code. See section 1-83(a) ("Any person who has reason to believe they have incurred pollution or diminution of a water source as a result of high volume hydraulic fracturing treatment of a well may notify the Department and request that an investigation be conducted") (emphasis added) and 1-83(d) ("if sampling results or other information obtained as part of the investigation or the results of tests conducted under subsection (c) of Section 1-80 of this Act indicate [pollution or diminution violations], the Department shall issue an order…") (emphasis added). In sum, it is clear hat section 85 of the Act creates a presumption of liability for all constituents contained in the Act's definition of "pollution or diminution," not solely for the constituents tested for under section 1-80. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process. Furthermore a number of provisions in the draft rules nonetheless inappropriately purport to limit evidence triggering the presumption to the section 1-80 sampling results. The particular provisions of concern are as follows: a. 245.620(b)(2) – the word "the" before "baseline water quality data" should be stricken to make clear that any baseline water quality data, not just the data collected pursuant to the

Act's requirements, may trigger the presumption. b. 245.620(b)(4) – this section should preferably be amended to mirror subparagraph (b)(2) (amended per above recommendation), i.e., state that "water quality data obtained up to 30 months after commencement of HVHHF operations shows that pollution or diminution of water quality has occurred with respect to one or more parameters" set forth in the relevant section of the Environmental Protection Act regulations referenced at 245.610(e). c. 245.620(c)(4) – this section is superfluous, as well as confusing for the reason specified below. If the water quality data (broadly defined per above) do not show pollution or diminution, then there is no presumption to rebut. The relevant concept from the statute that should be reflected here, and is not, is from subsection 1-85(c)(3), specifying that the presumption can be rebutted if it can be affirmatively established that the pollution or diminution had an identifiable cause other than HVHHF operations. To illustrate how severely the Department's unauthorized limitation of section 1-85 of the Act has curtailed its scope, we offer the following list of chemicals that are covered by the statutory definition of "pollution or diminution" that should therefore also be subject to the presumption according to the plain language of section 1-85. Shown capitalized are the few constituents that remain subject to the presumption under the Department's truncated interpretation: • Detection of any: BENZENE, any other carcinogen • Preventive Response Criteria at 35 IAC 620.310(a)(3)(A)(i): para-dichlorobenzene, ortho-dichlorobenzene, methyl tertiary butyl ether (MTBE), phenols, styrene, TOLUENE, ETHYLBENZENE, XYLENES, • 35 IAC 620.410: (a) antimony, ARSENIC, BARIUM, beryllium, CADMIUM, CHLORIDE, CHROMIUM, cobalt, copper, cyanide, fluoride, IRON, LEAD, MANGANESE, MERCURY, nickel, nitrate as n, perchlorate, Radium-226, Radium-228, SELENIUM, SILVER, SULFATE, thallium, TDS, vanadium, zinc; (b) Acenaphthene, Acetone, Alachlor*, Aldicarb, Anthracene, Atrazine, Benzene [repeat], Benzo(a)anthracene*, Benzo(b)flouranthene*, Benzo(k)floranthene*, Benzo(a)pyrene*, Benzoic acid, 2-Butanone (MEK), Carbofuran, Carbon Disulfide, Carbon Tetrachloride, Chlordane*, Chloroform*, Chrysene*, Dalapon, Dibenzo(a,h) anthracene*, Dicamba, Dichlorodiflouromethane; 1,1-Dichloroethane, Dichloromethane*, Di(2- ethylhexyl)phthalate*, Diethyl Phthalate, Di-n-butyl Phthalate, Dinoseb, Endothall, Endrin, Ethylene Dibromide*, Flouranthene, Flourene, Heptachlor*, Heptachlor Epoxide*, Hexachlorocyclopentadiene, Indeno(1,2,3-cd)pyrene*, Isopropylbenzene (Cumene), Lindane (Gamma-Haxachlorocyclohexane), 2,4-D, ortho-Dichlorobenzene, para-Dichlorobenzene; 1,2- Dibromo-3-Chloropropane*; 1,2-Dichloroethane*, 1,1 Dichloroethylene, cis-1,2- Dichloroethylene, trans-1,2-Dichloroethylene, 1,2-Dichloropropane*, Ethylbenzene, MCPP (Mecoprop), Methoxychlor, 2-Methylnaphthalene, 2-Methylphenol, Methyl Tertiary-Butyl Ether (MTBE), Monochlorobenzene, Naphthalene, P-Dioxane*, Pentachlorophenol*, Phenols, Picloram, Pyrene, Poly-chlorinated Biphenyls (PCBs) (as decachloro-biphenyl)*, alpha-BHC (alpha- Benzene hexachloride)*, Simazine, Styrene, 2,4,5-TP (Silvex), Tetrachloroethylene*, Toluene, Toxaphene*, 1,1,1-Trichloroethane; 1,1,2-Trichloroethane; 1,2,4- Trichlorobenzene; Trichloroethylene*; Trichlorofluoromethane; Vinyl Chloride*, Xylenes; (c) 1,3-Dinitrobenzene, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, HMX (High Melting Explosive, Octogen); Nitrobenzene; RDX (Royal Demolition Explosive, Cyclonite), 1,3,5- Trinitrobenzene; 2,4,6- Trinitrotoluene (TNT); (d) [repeats]; (e) PH. • Chemicals with 35 IAC 720 Groundwater Cleanup Objectives (not already listed above): Aldrin, Bis(2-chloroethyl)ether, Bis(2-ethylhexyl)phthalate (Di(2- ethylhexyl)phthalate), DDD, DDE, DDT, 1,2-Dibromoethane, 3,3'-Dichlorobenzidine, Dieldrin, Hexachlorobenzene, Alpha-HCH,

N-Nitrosodi-n-propylamine, 2,4,6-Trichlorophenol, Bromodichloromethane (Dichlorobromomethane), Bromoform, Butanol, butyl benzyl phthalate, carbazole, 4-Chloroaniline (r-Chloroaniline), Chlorobenzene (Monochlorobenzene), Chlorodibromomethane (Dibromochloromethane), 2-Chlorophenol (pH 4.9-7.3), 2-Chlorophenol (pH 7.4-8.0), 1,1-Dichloroethane, 2,4-Dichlorophenol, 1,2-Dichloropropane; 1,3-Dichloropropene (1,3-Dichloropropylene, cis + trans); Diethyl phthalate; 2,4- Dimethylphenol; 2,4-Dinitrophenol; Di-n-octyl phthalate; Endosulfan, Hexachloroethane, Isophorone; Methyl bromide (Bromomethane); Methyl tertiary-butyl ether; Methylene chloride (Dichloromethane); 2-Methylphenol (o-Cresol); N-Nitrosodiphenylamine; N-Nitrosodi-npropylamine; Pentachlorophenol; 2,4,5-Trichlorophenol (pH 4.9-7.8); 2,4,5-Trichlorophenol (pH 7.9-8.0); 2,4,6-Trichlorophenol (pH 4.9-6.8); 2,4,6-Trichlorophenol (pH 6.9-8.0); Vinyl acetate; Boron, CALCIUM; Chromium, ion, hexavalent; MAGNESIUM, phosphorus, potassium, sodium. We note that this concern is not by any means academic: at least some of these excluded constituents are found on FracFocus, indicating that they have been used in fracking operations.

Sincerely, Abraham Secular Chicago, IL 60615

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Section 1-85(a) states that it "establishes a rebuttable presumption for the purposes of evidence and liability under State law regarding claims of pollution or diminution of a water source and for use regarding the investigation and order authority under Section 1- 83" (emphasis added). The "and" is disjunctive, such that claims for pollution and diminution are not tied to or contingent on the investigation and order authority under section 1-83. Regardless, nothing in section 1-83 limits investigation and order authority to the constituents tested for under section 1-80; on the contrary, that section expressly references "pollution or diminution," which as discussed above is broadly defined with reference to the Illinois Administrative Code. See section 1-83(a) ("Any person who has reason to believe they have incurred pollution or diminution of a water source as a result of high volume hydraulic fracturing treatment of a well may notify the Department and request that an investigation be conducted") (emphasis added) and 1-83(d) ("if sampling results or other information obtained as part of the investigation or the results of tests conducted under subsection (c) of Section 1-80 of this Act indicate [pollution or diminution violations], the Department shall issue an order…") (emphasis added). In sum, it is clear hat section 85 of the Act creates a presumption of liability for all constituents contained in the Act's definition of "pollution or diminution," not solely for the constituents tested for under section 1-80. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process. Furthermore a number of provisions in the draft rules nonetheless inappropriately purport to limit evidence triggering the presumption to the section 1-80 sampling results. The particular provisions of concern are as follows: a. 245.620(b)(2) – the word "the" before "baseline water quality data" should be stricken to make clear that any baseline water quality data, not just the data collected pursuant to the

Act's requirements, may trigger the presumption. b. 245.620(b)(4) – this section should preferably be amended to mirror subparagraph (b)(2) (amended per above recommendation), i.e., state that "water quality data obtained up to 30 months after commencement of HVHHF operations shows that pollution or diminution of water quality has occurred with respect to one or more parameters" set forth in the relevant section of the Environmental Protection Act regulations referenced at 245.610(e). c. 245.620(c)(4) – this section is superfluous, as well as confusing for the reason specified below. If the water quality data (broadly defined per above) do not show pollution or diminution, then there is no presumption to rebut. The relevant concept from the statute that should be reflected here, and is not, is from subsection 1-85(c)(3), specifying that the presumption can be rebutted if it can be affirmatively established that the pollution or diminution had an identifiable cause other than HVHHF operations. To illustrate how severely the Department's unauthorized limitation of section 1-85 of the Act has curtailed its scope, we offer the following list of chemicals that are covered by the statutory definition of "pollution or diminution" that should therefore also be subject to the presumption according to the plain language of section 1-85. Shown capitalized are the few constituents that remain subject to the presumption under the Department's truncated interpretation: • Detection of any: BENZENE, any other carcinogen • Preventive Response Criteria at 35 IAC 620.310(a)(3)(A)(i): para-dichlorobenzene, ortho-dichlorobenzene, methyl tertiary butyl ether (MTBE), phenols, styrene, TOLUENE, ETHYLBENZENE, XYLENES, • 35 IAC 620.410: (a) antimony, ARSENIC, BARIUM, beryllium, CADMIUM, CHLORIDE, CHROMIUM, cobalt, copper, cyanide, fluoride, IRON, LEAD, MANGANESE, MERCURY, nickel, nitrate as n, perchlorate, Radium-226, Radium-228, SELENIUM, SILVER, SULFATE, thallium, TDS, vanadium, zinc; (b) Acenaphthene, Acetone, Alachlor*, Aldicarb, Anthracene, Atrazine, Benzene [repeat], Benzo(a)anthracene*, Benzo(b)flouranthene*, Benzo(k)floranthene*, Benzo(a)pyrene*, Benzoic acid, 2-Butanone (MEK), Carbofuran, Carbon Disulfide, Carbon Tetrachloride, Chlordane*, Chloroform*, Chrysene*, Dalapon, Dibenzo(a,h) anthracene*, Dicamba, Dichlorodiflouromethane; 1,1-Dichloroethane, Dichloromethane*, Di(2- ethylhexyl)phthalate*, Diethyl Phthalate, Di-n-butyl Phthalate, Dinoseb, Endothall, Endrin, Ethylene Dibromide*, Flouranthene, Flourene, Heptachlor*, Heptachlor Epoxide*, Hexachlorocyclopentadiene, Indeno(1,2,3-cd)pyrene*, Isopropylbenzene (Cumene), Lindane (Gamma-Haxachlorocyclohexane), 2,4-D, ortho-Dichlorobenzene, para-Dichlorobenzene; 1,2- Dibromo-3-Chloropropane*; 1,2-Dichloroethane*, 1,1 Dichloroethylene, cis-1,2- Dichloroethylene, trans-1,2-Dichloroethylene, 1,2-Dichloropropane*, Ethylbenzene, MCPP (Mecoprop), Methoxychlor, 2-Methylnaphthalene, 2-Methylphenol, Methyl Tertiary-Butyl Ether (MTBE), Monochlorobenzene, Naphthalene, P-Dioxane*, Pentachlorophenol*, Phenols, Picloram, Pyrene, Poly-chlorinated Biphenyls (PCBs) (as decachloro-biphenyl)*, alpha-BHC (alpha- Benzene hexachloride)*, Simazine, Styrene, 2,4,5-TP (Silvex), Tetrachloroethylene*, Toluene, Toxaphene*, 1,1,1-Trichloroethane; 1,1,2-Trichloroethane; 1,2,4- Trichlorobenzene; Trichloroethylene*; Trichlorofluoromethane; Vinyl Chloride*, Xylenes; (c) 1,3-Dinitrobenzene, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, HMX (High Melting Explosive, Octogen); Nitrobenzene; RDX (Royal Demolition Explosive, Cyclonite), 1,3,5- Trinitrobenzene; 2,4,6- Trinitrotoluene (TNT); (d) [repeats]; (e) PH. • Chemicals with 35 IAC 720 Groundwater Cleanup Objectives (not already listed above): Aldrin, Bis(2-chloroethyl)ether, Bis(2-ethylhexyl)phthalate (Di(2- ethylhexyl)phthalate), DDD, DDE, DDT, 1,2-Dibromoethane, 3,3'-Dichlorobenzidine, Dieldrin, Hexachlorobenzene, Alpha-HCH,

N-Nitrosodi-n-propylamine, 2,4,6-Trichlorophenol, Bromodichloromethane (Dichlorobromomethane), Bromoform, Butanol, butyl benzyl phthalate, carbazole, 4-Chloroaniline (r-Chloroaniline), Chlorobenzene (Monochlorobenzene), Chlorodibromomethane (Dibromochloromethane), 2-Chlorophenol (pH 4.9-7.3), 2-Chlorophenol (pH 7.4-8.0), 1,1-Dichloroethane, 2,4-Dichlorophenol, 1,2-Dichloropropane; 1,3-Dichloropropene (1,3-Dichloropropylene, cis + trans); Diethyl phthalate; 2,4- Dimethylphenol; 2,4-Dinitrophenol; Di-n-octyl phthalate; Endosulfan, Hexachloroethane, Isophorone; Methyl bromide (Bromomethane); Methyl tertiary-butyl ether; Methylene chloride (Dichloromethane); 2-Methylphenol (o-Cresol); N-Nitrosodiphenylamine; N-Nitrosodi-npropylamine; Pentachlorophenol; 2,4,5-Trichlorophenol (pH 4.9-7.8); 2,4,5-Trichlorophenol (pH 7.9-8.0); 2,4,6-Trichlorophenol (pH 4.9-6.8); 2,4,6-Trichlorophenol (pH 6.9-8.0); Vinyl acetate; Boron, CALCIUM; Chromium, ion, hexavalent; MAGNESIUM, phosphorus, potassium, sodium. We note that this concern is not by any means academic: at least some of these excluded constituents are found on FracFocus, indicating that they have been used in fracking operations.

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Section 1-85(a) states that it "establishes a rebuttable presumption for the purposes of evidence and liability under State law regarding claims of pollution or diminution of a water source and for use regarding the investigation and order authority under Section 1- 83" (emphasis added). The "and" is disjunctive, such that claims for pollution and diminution are not tied to or contingent on the investigation and order authority under section 1-83. Regardless, nothing in section 1-83 limits investigation and order authority to the constituents tested for under section 1-80; on the contrary, that section expressly references "pollution or diminution," which as discussed above is broadly defined with reference to the Illinois Administrative Code. See section 1-83(a) ("Any person who has reason to believe they have incurred pollution or diminution of a water source as a result of high volume hydraulic fracturing treatment of a well may notify the Department and request that an investigation be conducted") (emphasis added) and 1-83(d) ("if sampling results or other information obtained as part of the investigation or the results of tests conducted under subsection (c) of Section 1-80 of this Act indicate [pollution or diminution violations], the Department shall issue an order…") (emphasis added). In sum, it is clear hat section 85 of the Act creates a presumption of liability for all constituents contained in the Act's definition of "pollution or diminution," not solely for the constituents tested for under section 1-80. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process. Furthermore a number of provisions in the draft rules nonetheless inappropriately purport to limit evidence triggering the presumption to the section 1-80 sampling results. The particular provisions of concern are as follows: a. 245.620(b)(2) – the word "the" before "baseline water quality data" should be stricken to make clear that any baseline water quality data, not just the data collected pursuant to the

Act's requirements, may trigger the presumption. b. 245.620(b)(4) – this section should preferably be amended to mirror subparagraph (b)(2) (amended per above recommendation), i.e., state that "water quality data obtained up to 30 months after commencement of HVHHF operations shows that pollution or diminution of water quality has occurred with respect to one or more parameters" set forth in the relevant section of the Environmental Protection Act regulations referenced at 245.610(e). c. 245.620(c)(4) – this section is superfluous, as well as confusing for the reason specified below. If the water quality data (broadly defined per above) do not show pollution or diminution, then there is no presumption to rebut. The relevant concept from the statute that should be reflected here, and is not, is from subsection 1-85(c)(3), specifying that the presumption can be rebutted if it can be affirmatively established that the pollution or diminution had an identifiable cause other than HVHHF operations. To illustrate how severely the Department's unauthorized limitation of section 1-85 of the Act has curtailed its scope, we offer the following list of chemicals that are covered by the statutory definition of "pollution or diminution" that should therefore also be subject to the presumption according to the plain language of section 1-85. Shown capitalized are the few constituents that remain subject to the presumption under the Department's truncated interpretation: • Detection of any: BENZENE, any other carcinogen • Preventive Response Criteria at 35 IAC 620.310(a)(3)(A)(i): para-dichlorobenzene, ortho-dichlorobenzene, methyl tertiary butyl ether (MTBE), phenols, styrene, TOLUENE, ETHYLBENZENE, XYLENES, • 35 IAC 620.410: (a) antimony, ARSENIC, BARIUM, beryllium, CADMIUM, CHLORIDE, CHROMIUM, cobalt, copper, cyanide, fluoride, IRON, LEAD, MANGANESE, MERCURY, nickel, nitrate as n, perchlorate, Radium-226, Radium-228, SELENIUM, SILVER, SULFATE, thallium, TDS, vanadium, zinc; (b) Acenaphthene, Acetone, Alachlor*, Aldicarb, Anthracene, Atrazine, Benzene [repeat], Benzo(a)anthracene*, Benzo(b)flouranthene*, Benzo(k)floranthene*, Benzo(a)pyrene*, Benzoic acid, 2-Butanone (MEK), Carbofuran, Carbon Disulfide, Carbon Tetrachloride, Chlordane*, Chloroform*, Chrysene*, Dalapon, Dibenzo(a,h) anthracene*, Dicamba, Dichlorodiflouromethane; 1,1-Dichloroethane, Dichloromethane*, Di(2- ethylhexyl)phthalate*, Diethyl Phthalate, Di-n-butyl Phthalate, Dinoseb, Endothall, Endrin, Ethylene Dibromide*, Flouranthene, Flourene, Heptachlor*, Heptachlor Epoxide*, Hexachlorocyclopentadiene, Indeno(1,2,3-cd)pyrene*, Isopropylbenzene (Cumene), Lindane (Gamma-Haxachlorocyclohexane), 2,4-D, ortho-Dichlorobenzene, para-Dichlorobenzene; 1,2- Dibromo-3-Chloropropane*; 1,2-Dichloroethane*, 1,1 Dichloroethylene, cis-1,2- Dichloroethylene, trans-1,2-Dichloroethylene, 1,2-Dichloropropane*, Ethylbenzene, MCPP (Mecoprop), Methoxychlor, 2-Methylnaphthalene, 2-Methylphenol, Methyl Tertiary-Butyl Ether (MTBE), Monochlorobenzene, Naphthalene, P-Dioxane*, Pentachlorophenol*, Phenols, Picloram, Pyrene, Poly-chlorinated Biphenyls (PCBs) (as decachloro-biphenyl)*, alpha-BHC (alpha- Benzene hexachloride)*, Simazine, Styrene, 2,4,5-TP (Silvex), Tetrachloroethylene*, Toluene, Toxaphene*, 1,1,1-Trichloroethane; 1,1,2-Trichloroethane; 1,2,4- Trichlorobenzene; Trichloroethylene*; Trichlorofluoromethane; Vinyl Chloride*, Xylenes; (c) 1,3-Dinitrobenzene, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, HMX (High Melting Explosive, Octogen); Nitrobenzene; RDX (Royal Demolition Explosive, Cyclonite), 1,3,5- Trinitrobenzene; 2,4,6- Trinitrotoluene (TNT); (d) [repeats]; (e) PH. • Chemicals with 35 IAC 720 Groundwater Cleanup Objectives (not already listed above): Aldrin, Bis(2-chloroethyl)ether, Bis(2-ethylhexyl)phthalate (Di(2- ethylhexyl)phthalate), DDD, DDE, DDT, 1,2-Dibromoethane, 3,3'-Dichlorobenzidine, Dieldrin, Hexachlorobenzene, Alpha-HCH,

N-Nitrosodi-n-propylamine, 2,4,6-Trichlorophenol, Bromodichloromethane (Dichlorobromomethane), Bromoform, Butanol, butyl benzyl phthalate, carbazole, 4-Chloroaniline (r-Chloroaniline), Chlorobenzene (Monochlorobenzene), Chlorodibromomethane (Dibromochloromethane), 2-Chlorophenol (pH 4.9-7.3), 2-Chlorophenol (pH 7.4-8.0), 1,1-Dichloroethane, 2,4-Dichlorophenol, 1,2-Dichloropropane; 1,3-Dichloropropene (1,3-Dichloropropylene, cis + trans); Diethyl phthalate; 2,4- Dimethylphenol; 2,4-Dinitrophenol; Di-n-octyl phthalate; Endosulfan, Hexachloroethane, Isophorone; Methyl bromide (Bromomethane); Methyl tertiary-butyl ether; Methylene chloride (Dichloromethane); 2-Methylphenol (o-Cresol); N-Nitrosodiphenylamine; N-Nitrosodi-npropylamine; Pentachlorophenol; 2,4,5-Trichlorophenol (pH 4.9-7.8); 2,4,5-Trichlorophenol (pH 7.9-8.0); 2,4,6-Trichlorophenol (pH 4.9-6.8); 2,4,6-Trichlorophenol (pH 6.9-8.0); Vinyl acetate; Boron, CALCIUM; Chromium, ion, hexavalent; MAGNESIUM, phosphorus, potassium, sodium. We note that this concern is not by any means academic: at least some of these excluded constituents are found on FracFocus, indicating that they have been used in fracking operations.

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Section 1-85(a) states that it "establishes a rebuttable presumption for the purposes of evidence and liability under State law regarding claims of pollution or diminution of a water source and for use regarding the investigation and order authority under Section 1- 83" (emphasis added). The "and" is disjunctive, such that claims for pollution and diminution are not tied to or contingent on the investigation and order authority under section 1-83. Regardless, nothing in section 1-83 limits investigation and order authority to the constituents tested for under section 1-80; on the contrary, that section expressly references "pollution or diminution," which as discussed above is broadly defined with reference to the Illinois Administrative Code. See section 1-83(a) ("Any person who has reason to believe they have incurred pollution or diminution of a water source as a result of high volume hydraulic fracturing treatment of a well may notify the Department and request that an investigation be conducted") (emphasis added) and 1-83(d) ("if sampling results or other information obtained as part of the investigation or the results of tests conducted under subsection (c) of Section 1-80 of this Act indicate [pollution or diminution violations], the Department shall issue an order…") (emphasis added). In sum, it is clear hat section 85 of the Act creates a presumption of liability for all constituents contained in the Act's definition of "pollution or diminution," not solely for the constituents tested for under section 1-80. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process. Furthermore a number of provisions in the draft rules nonetheless inappropriately purport to limit evidence triggering the presumption to the section 1-80 sampling results. The particular provisions of concern are as follows: a. 245.620(b)(2) – the word "the" before "baseline water quality data" should be stricken to make clear that any baseline water quality data, not just the data collected pursuant to the

Act's requirements, may trigger the presumption. b. 245.620(b)(4) – this section should preferably be amended to mirror subparagraph (b)(2) (amended per above recommendation), i.e., state that "water quality data obtained up to 30 months after commencement of HVHHF operations shows that pollution or diminution of water quality has occurred with respect to one or more parameters" set forth in the relevant section of the Environmental Protection Act regulations referenced at 245.610(e). c. 245.620(c)(4) – this section is superfluous, as well as confusing for the reason specified below. If the water quality data (broadly defined per above) do not show pollution or diminution, then there is no presumption to rebut. The relevant concept from the statute that should be reflected here, and is not, is from subsection 1-85(c)(3), specifying that the presumption can be rebutted if it can be affirmatively established that the pollution or diminution had an identifiable cause other than HVHHF operations. To illustrate how severely the Department's unauthorized limitation of section 1-85 of the Act has curtailed its scope, we offer the following list of chemicals that are covered by the statutory definition of "pollution or diminution" that should therefore also be subject to the presumption according to the plain language of section 1-85. Shown capitalized are the few constituents that remain subject to the presumption under the Department's truncated interpretation: • Detection of any: BENZENE, any other carcinogen • Preventive Response Criteria at 35 IAC 620.310(a)(3)(A)(i): para-dichlorobenzene, ortho-dichlorobenzene, methyl tertiary butyl ether (MTBE), phenols, styrene, TOLUENE, ETHYLBENZENE, XYLENES, • 35 IAC 620.410: (a) antimony, ARSENIC, BARIUM, beryllium, CADMIUM, CHLORIDE, CHROMIUM, cobalt, copper, cyanide, fluoride, IRON, LEAD, MANGANESE, MERCURY, nickel, nitrate as n, perchlorate, Radium-226, Radium-228, SELENIUM, SILVER, SULFATE, thallium, TDS, vanadium, zinc; (b) Acenaphthene, Acetone, Alachlor*, Aldicarb, Anthracene, Atrazine, Benzene [repeat], Benzo(a)anthracene*, Benzo(b)flouranthene*, Benzo(k)floranthene*, Benzo(a)pyrene*, Benzoic acid, 2-Butanone (MEK), Carbofuran, Carbon Disulfide, Carbon Tetrachloride, Chlordane*, Chloroform*, Chrysene*, Dalapon, Dibenzo(a,h) anthracene*, Dicamba, Dichlorodiflouromethane; 1,1-Dichloroethane, Dichloromethane*, Di(2- ethylhexyl)phthalate*, Diethyl Phthalate, Di-n-butyl Phthalate, Dinoseb, Endothall, Endrin, Ethylene Dibromide*, Flouranthene, Flourene, Heptachlor*, Heptachlor Epoxide*, Hexachlorocyclopentadiene, Indeno(1,2,3-cd)pyrene*, Isopropylbenzene (Cumene), Lindane (Gamma-Haxachlorocyclohexane), 2,4-D, ortho-Dichlorobenzene, para-Dichlorobenzene; 1,2- Dibromo-3-Chloropropane*; 1,2-Dichloroethane*, 1,1 Dichloroethylene, cis-1,2- Dichloroethylene, trans-1,2-Dichloroethylene, 1,2-Dichloropropane*, Ethylbenzene, MCPP (Mecoprop), Methoxychlor, 2-Methylnaphthalene, 2-Methylphenol, Methyl Tertiary-Butyl Ether (MTBE), Monochlorobenzene, Naphthalene, P-Dioxane*, Pentachlorophenol*, Phenols, Picloram, Pyrene, Poly-chlorinated Biphenyls (PCBs) (as decachloro-biphenyl)*, alpha-BHC (alpha- Benzene hexachloride)*, Simazine, Styrene, 2,4,5-TP (Silvex), Tetrachloroethylene*, Toluene, Toxaphene*, 1,1,1-Trichloroethane; 1,1,2-Trichloroethane; 1,2,4- Trichlorobenzene; Trichloroethylene*; Trichlorofluoromethane; Vinyl Chloride*, Xylenes; (c) 1,3-Dinitrobenzene, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, HMX (High Melting Explosive, Octogen); Nitrobenzene; RDX (Royal Demolition Explosive, Cyclonite), 1,3,5- Trinitrobenzene; 2,4,6- Trinitrotoluene (TNT); (d) [repeats]; (e) PH. • Chemicals with 35 IAC 720 Groundwater Cleanup Objectives (not already listed above): Aldrin, Bis(2-chloroethyl)ether, Bis(2-ethylhexyl)phthalate (Di(2- ethylhexyl)phthalate), DDD, DDE, DDT, 1,2-Dibromoethane, 3,3'-Dichlorobenzidine, Dieldrin, Hexachlorobenzene, Alpha-HCH,

N-Nitrosodi-n-propylamine, 2,4,6-Trichlorophenol, Bromodichloromethane (Dichlorobromomethane), Bromoform, Butanol, butyl benzyl phthalate, carbazole, 4-Chloroaniline (r-Chloroaniline), Chlorobenzene (Monochlorobenzene), Chlorodibromomethane (Dibromochloromethane), 2-Chlorophenol (pH 4.9-7.3), 2-Chlorophenol (pH 7.4-8.0), 1,1-Dichloroethane, 2,4-Dichlorophenol, 1,2-Dichloropropane; 1,3-Dichloropropene (1,3-Dichloropropylene, cis + trans); Diethyl phthalate; 2,4- Dimethylphenol; 2,4-Dinitrophenol; Di-n-octyl phthalate; Endosulfan, Hexachloroethane, Isophorone; Methyl bromide (Bromomethane); Methyl tertiary-butyl ether; Methylene chloride (Dichloromethane); 2-Methylphenol (o-Cresol); N-Nitrosodiphenylamine; N-Nitrosodi-npropylamine; Pentachlorophenol; 2,4,5-Trichlorophenol (pH 4.9-7.8); 2,4,5-Trichlorophenol (pH 7.9-8.0); 2,4,6-Trichlorophenol (pH 4.9-6.8); 2,4,6-Trichlorophenol (pH 6.9-8.0); Vinyl acetate; Boron, CALCIUM; Chromium, ion, hexavalent; MAGNESIUM, phosphorus, potassium, sodium. We note that this concern is not by any means academic: at least some of these excluded constituents are found on FracFocus, indicating that they have been used in fracking operations.

Sincerely, Aija Nemer-Aanerud Chicago, IL 60615

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process.

Sincerely, Alen Makhmudov Chicago, IL 60637

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Section 1-85(a) states that it "establishes a rebuttable presumption for the purposes of evidence and liability under State law regarding claims of pollution or diminution of a water source and for use regarding the investigation and order authority under Section 1- 83" (emphasis added). The "and" is disjunctive, such that claims for pollution and diminution are not tied to or contingent on the investigation and order authority under section 1-83. Regardless, nothing in section 1-83 limits investigation and order authority to the constituents tested for under section 1-80; on the contrary, that section expressly references "pollution or diminution," which as discussed above is broadly defined with reference to the Illinois Administrative Code. See section 1-83(a) ("Any person who has reason to believe they have incurred pollution or diminution of a water source as a result of high volume hydraulic fracturing treatment of a well may notify the Department and request that an investigation be conducted") (emphasis added) and 1-83(d) ("if sampling results or other information obtained as part of the investigation or the results of tests conducted under subsection (c) of Section 1-80 of this Act indicate [pollution or diminution violations], the Department shall issue an order…") (emphasis added). In sum, it is clear hat section 85 of the Act creates a presumption of liability for all constituents contained in the Act's definition of "pollution or diminution," not solely for the constituents tested for under section 1-80. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process. Furthermore a number of provisions in the draft rules nonetheless inappropriately purport to limit evidence triggering the presumption to the section 1-80 sampling results. The particular provisions of concern are as follows: a. 245.620(b)(2) – the word "the" before "baseline water quality data" should be stricken to make clear that any baseline water quality data, not just the data collected pursuant to the

Act's requirements, may trigger the presumption. b. 245.620(b)(4) – this section should preferably be amended to mirror subparagraph (b)(2) (amended per above recommendation), i.e., state that "water quality data obtained up to 30 months after commencement of HVHHF operations shows that pollution or diminution of water quality has occurred with respect to one or more parameters" set forth in the relevant section of the Environmental Protection Act regulations referenced at 245.610(e). c. 245.620(c)(4) – this section is superfluous, as well as confusing for the reason specified below. If the water quality data (broadly defined per above) do not show pollution or diminution, then there is no presumption to rebut. The relevant concept from the statute that should be reflected here, and is not, is from subsection 1-85(c)(3), specifying that the presumption can be rebutted if it can be affirmatively established that the pollution or diminution had an identifiable cause other than HVHHF operations. To illustrate how severely the Department's unauthorized limitation of section 1-85 of the Act has curtailed its scope, we offer the following list of chemicals that are covered by the statutory definition of "pollution or diminution" that should therefore also be subject to the presumption according to the plain language of section 1-85. Shown capitalized are the few constituents that remain subject to the presumption under the Department's truncated interpretation: • Detection of any: BENZENE, any other carcinogen • Preventive Response Criteria at 35 IAC 620.310(a)(3)(A)(i): para-dichlorobenzene, ortho-dichlorobenzene, methyl tertiary butyl ether (MTBE), phenols, styrene, TOLUENE, ETHYLBENZENE, XYLENES, • 35 IAC 620.410: (a) antimony, ARSENIC, BARIUM, beryllium, CADMIUM, CHLORIDE, CHROMIUM, cobalt, copper, cyanide, fluoride, IRON, LEAD, MANGANESE, MERCURY, nickel, nitrate as n, perchlorate, Radium-226, Radium-228, SELENIUM, SILVER, SULFATE, thallium, TDS, vanadium, zinc; (b) Acenaphthene, Acetone, Alachlor*, Aldicarb, Anthracene, Atrazine, Benzene [repeat], Benzo(a)anthracene*, Benzo(b)flouranthene*, Benzo(k)floranthene*, Benzo(a)pyrene*, Benzoic acid, 2-Butanone (MEK), Carbofuran, Carbon Disulfide, Carbon Tetrachloride, Chlordane*, Chloroform*, Chrysene*, Dalapon, Dibenzo(a,h) anthracene*, Dicamba, Dichlorodiflouromethane; 1,1-Dichloroethane, Dichloromethane*, Di(2- ethylhexyl)phthalate*, Diethyl Phthalate, Di-n-butyl Phthalate, Dinoseb, Endothall, Endrin, Ethylene Dibromide*, Flouranthene, Flourene, Heptachlor*, Heptachlor Epoxide*, Hexachlorocyclopentadiene, Indeno(1,2,3-cd)pyrene*, Isopropylbenzene (Cumene), Lindane (Gamma-Haxachlorocyclohexane), 2,4-D, ortho-Dichlorobenzene, para-Dichlorobenzene; 1,2- Dibromo-3-Chloropropane*; 1,2-Dichloroethane*, 1,1 Dichloroethylene, cis-1,2- Dichloroethylene, trans-1,2-Dichloroethylene, 1,2-Dichloropropane*, Ethylbenzene, MCPP (Mecoprop), Methoxychlor, 2-Methylnaphthalene, 2-Methylphenol, Methyl Tertiary-Butyl Ether (MTBE), Monochlorobenzene, Naphthalene, P-Dioxane*, Pentachlorophenol*, Phenols, Picloram, Pyrene, Poly-chlorinated Biphenyls (PCBs) (as decachloro-biphenyl)*, alpha-BHC (alpha- Benzene hexachloride)*, Simazine, Styrene, 2,4,5-TP (Silvex), Tetrachloroethylene*, Toluene, Toxaphene*, 1,1,1-Trichloroethane; 1,1,2-Trichloroethane; 1,2,4- Trichlorobenzene; Trichloroethylene*; Trichlorofluoromethane; Vinyl Chloride*, Xylenes; (c) 1,3-Dinitrobenzene, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, HMX (High Melting Explosive, Octogen); Nitrobenzene; RDX (Royal Demolition Explosive, Cyclonite), 1,3,5- Trinitrobenzene; 2,4,6- Trinitrotoluene (TNT); (d) [repeats]; (e) PH. • Chemicals with 35 IAC 720 Groundwater Cleanup Objectives (not already listed above): Aldrin, Bis(2-chloroethyl)ether, Bis(2-ethylhexyl)phthalate (Di(2- ethylhexyl)phthalate), DDD, DDE, DDT, 1,2-Dibromoethane, 3,3'-Dichlorobenzidine, Dieldrin, Hexachlorobenzene, Alpha-HCH,

N-Nitrosodi-n-propylamine, 2,4,6-Trichlorophenol, Bromodichloromethane (Dichlorobromomethane), Bromoform, Butanol, butyl benzyl phthalate, carbazole, 4-Chloroaniline (r-Chloroaniline), Chlorobenzene (Monochlorobenzene), Chlorodibromomethane (Dibromochloromethane), 2-Chlorophenol (pH 4.9-7.3), 2-Chlorophenol (pH 7.4-8.0), 1,1-Dichloroethane, 2,4-Dichlorophenol, 1,2-Dichloropropane; 1,3-Dichloropropene (1,3-Dichloropropylene, cis + trans); Diethyl phthalate; 2,4- Dimethylphenol; 2,4-Dinitrophenol; Di-n-octyl phthalate; Endosulfan, Hexachloroethane, Isophorone; Methyl bromide (Bromomethane); Methyl tertiary-butyl ether; Methylene chloride (Dichloromethane); 2-Methylphenol (o-Cresol); N-Nitrosodiphenylamine; N-Nitrosodi-npropylamine; Pentachlorophenol; 2,4,5-Trichlorophenol (pH 4.9-7.8); 2,4,5-Trichlorophenol (pH 7.9-8.0); 2,4,6-Trichlorophenol (pH 4.9-6.8); 2,4,6-Trichlorophenol (pH 6.9-8.0); Vinyl acetate; Boron, CALCIUM; Chromium, ion, hexavalent; MAGNESIUM, phosphorus, potassium, sodium. We note that this concern is not by any means academic: at least some of these excluded constituents are found on FracFocus, indicating that they have been used in fracking operations.

In reference to Subpart F: Water Quality

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process.

Sincerely, Alexandra Lynn Chicago, IL 606

Section 245.620 Rebuttable Presumption of Pollution or Diminution

Section 1-80 of the Act governing Water Quality Monitoring provides a list of indicator chemicals that would suggest water contamination has occurred but doesn't limit what may be tested for. In fact, this section of the law states that "Sampling shall, at a minimum, be consistent with the work plan and allow for a determination of whether any hydraulic fracturing additive or other contaminant has caused pollution or diminution for purposes of Sections 1-83 and 1-85 of this Act." Section 1-85 of the Act governing the presumption of pollution or diminution does not limit the sources of sampling data that may be used to prove the pollution or diminution has occurred. And yet, the IDNR Rules in Section 245.620 have narrowed the statutory basis for the presumption, treating Section 1-80's list of "indicator chemicals" as a comprehensive list of what should be tested for. The 1-80 parameters are intended to be INDICATORS of the presence of contamination from hydraulic fracturing, not an exclusive list of the possible contaminating constituents. There are over 700 chemicals used in fracking. 1-80 lists only a handful of them. A reasonable person would conclude that if a chemical other than those on the list of indicator chemicals was found and that chemical was part of the list of chemicals in the fracking operator's work plan, then the operator would be presumed to be responsible for that contamination. Revisions Needed: Section 245.620 must reflect the intent of the law that the operator will be responsible for any pollution or diminution caused by fracking. This responsibility will not be limited to a list of indicator chemicals but will include all chemicals used in the fracturing process.
