Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Frank Pettis Chicago, IL 60605

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Johh Haggerty NYC, IL 11215

In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Leilani Douglas Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Navroz Tharani Chicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Preethi Sekhar Naperville, IL 60564

In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Sandeep Malladi Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, "The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits." (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Vadim Tanyoin Chicago, IL 60637

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits. (Section 1-65(a) of the Act) I read a study called “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, written by the PennEnvironment Research & Policy Center which reported documented instances in which fracking wells have cost $700,000 or more to plug. If I were a fracking company owner, I would prefer to simply pay the bond rather than do the right thing and plug the well for 700,000. I would take the extra 650,000 dollars that I made from ruining the environment to buy more ferraris.

Sincerely, Harry Li 2656 Boddington Lane Naperville, IL 60564

Section 245.220 states, The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits. (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, B. E. Murphy 458 Tahoe Park Forest, IL 60466

In reference to Subpart B: Registration and Permitting Procedures

Section 245.220 Permit Bonds or Other Collateral Securities

Section 245.220 states, The bond shall be in the amount of $50,000 per permit or a blanket bond of $500,000 for all permits. (Section 1-65(a) of the Act) Plugging a well alone costs more than $50,000. In the study “Who Pays the Cost of Fracking?: Weak Bonding Rules for Oil and Gas Drilling Leave the Public At Risk”, PennEnvironment Research & Policy Center reported documented instances in which fracking wells have cost $700,000 or more to plug. What is the motivation for the operator to not simply forfeit the bond when they shut down? Furthermore, drilling companies typically frack a string of wells and not just one. If they are cutting corners, using improper well-casings for example, or not sealing them correctly, the violation is likely to occur at each site. One $500,000 bond for perhaps as many as 100 - 150 well sites is as unacceptable as a $50,000 for one well site. If the purpose of the bond is to protect the state from expenses incurred from an accident or violation, then the bond must be sufficient to cover those occurrences. It makes no sense to offer a blanket bond—like some bargain basement "buy 2 pairs of socks and get a third pair free". Each well should be bonded individually and in the amount necessary to cover real and imagined damages as outlined by the PennEnvironment study.

Sincerely, Micah Bennett Marion, IL 62959

Section 245.220 Permit Bonds or Other Collateral Securities

This section sounds like an attempt to appease environmentalists, not a realistic assessment of restitution for the damages that fracking has been known to cause at other sites. It needs to be rewritten to cover all of the damages that are likely to occur. If no damages occur, nothing has been lost. If damages to a well occur, the owners have a right to be reimbursed fully.

Sincerely, Clare Boehmer Reb Bud, IL 62278

Section 245.230 Permit Application Receipt and Department Review

After taking time to look over the proposed rules and regulations for hydraulic fracturing in Illinois I find the rules to be inadequate and quite frankly I find them to be a joke. To start things off, the Rules state "Published studies or reports, and sources of underlying data, used to compose this rulemaking: None". While in high school, and especially now as a college student pursuing a higher education, I write plenty of papers and I find this lack of studies and sources of underlying data to be quite distasteful. It is near finals week for me and I have several research papers that I am currently writing. These papers are a mere 8-10 pages each (versus the 135 page document for proposed rules composed by your department) and for each paper I have to use at least 6-8 sources. This is a paper we are talking about and though it is important to my learning and education to be writing it, it is not something as serious as hydraulic fracturing. I seriously question your department's competence, or lack thereof, with regards to this. If you are not going to consult science and cold hard facts (unbiased in the least) while drafting the rules, then hydraulic fracturing should not even be a question in Illinois: It should simply not be allowed because we are not adequately preparing for it or examining it.

Sincerely, Lou Bass Richton Park , IL 60471

Section 245.230 Permit Application Receipt and Department Review

Comment Submission for H.V.H.Fracking Draft Rules, My comment pertains to Subsection 245.230(d) & (e) of the Rules which gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. The problem with this is that it doesn't stop the 60-day time-period from continuing. This situation could be a problem because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by applicants who could submit incomplete applications and withhold permit information until late in the process, thereby denying the public out of valuable time needed to review the application and prepare for a hearing. Here are some possible revisions that could help this situation.This section should provide that the Department's 60-day review period does not begin until the application is deemed complete by the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe. Thank you for your consideration in this matter. Lucia Amorelli

Sincerely, Lucia Amorelli 1690 Sheppard Ln. Makanda, IL 62958

In reference to Subpart B: Registration and Permitting Procedures

Section 245.230 Permit Application Receipt and Department Review

IDNR's rules set up the system by which hydraulic fracturing permit applications are approved. Under Subsection 245.230(d) & (e) of the rules, IDNR has 60 days to review and approve or reject the permit application. The General Assembly's Hydraulic Fracturing Regulatory act requires in Section 1-35 (f) that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” However, under IDNR's rules, if IDNR finds the application to be incomplete, it must provide written notification to the applicant and allow the applicant to correct them. However, the rules do not require that the 60-day review period recommence with the revision and resubmission of the permit application. If only graduate students had it so good. Hey, advisor! I realize that the first draft of my master's thesis was terrible, but here is the new version the day it's due five minutes before the end of the day. This would never fly in graduate school; I'm not sure why fracturing operators should have it so easy--especially when people's lives and health are at risk. The 60-day period is not just a time for IDNR to review the application, it is also the time that the public has been provided to prepare for the hearing. If a fracturing operator submits an incomplete application and then submits revisions at the end of the 60-day period, there will be no opportunity for the public to prepare for a hearing, let alone discuss or comment on the implications of the potential operation. IDNR's 60-day review period should not begin until the application is deemed complete by the department. Applicants with incomplete applications should be required to waive the 60-day requirement until such date as the application is complete. If the applicant refuses to do so, then IDNR should automatically reject the application and deny the permit. In addition, the public comment period should only begin once a complete permit application is submitted.

Sincerely, Sara Buck Chicago , IL 60640

Relevant parts of the Proposed Administrative Rules: 245.230 Permit Application Receipt and Department Review Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Treesong 2030 S Illinois Ave #9 Carbondale, IL 62903

Section 245.230 Permit Application Receipt and Department Review

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Bob Venier Dixon, IL 61021

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Dominic Giafagleone 29 Chateau Rd Carbondale, IL 62901

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Eve Zuckerman CHicago, IL 60615

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, John Gamino Chicago, IL 60615

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Kristen Rosario Chicago, IL 60605

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Mansi Kathuria Chicago, IL 60647

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Paulo Nacimiento Chicago, IL 60637

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Rebecca McBride Mahomet, IL 61875

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Scott Condren Chicago, IL 60608

If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Westin Campo chicago, IL 60608

In reference to Subpart B: Registration and Permitting Procedures

Section 245.230 Permit Application Receipt and Department Review

Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. Section 245.230 Permit Application Receipt and Department Review

This comment relates to 245.230, the time period for permit review by IDNR. The time period for IDNR should not begin until the applicant has submitted a complete application. IDNR needs to have a complete application to fully evaluate whether a permit will be granted. If the applicant submits an incomplete application, that should not prevent IDNR from giving it the full 60 day review necessary.

Sincerely, Eileen Sutter 4125 North Monticello Chicago, IL 60618

This in America? Several Fracking incidents have forced people out their homes, in Texas and Pennsylvania. Are we going to really destroy families because we no longer want to go to another country for oil? Now that prosperous and cold hearted. My family as well as everyone else family should be kept from those harms. While corporations are thinking profit, guess who has to really pay? We do. Guess who has to breathe in that air? We do. We should stop letting corporations control what they do to us. We are all born on this earth as equals. Why should I let a man , one who bleeds the same blood I do, decide whether I should die or move from even move from my home state for his benefits and profits ?That is so preposterous!!!! Fracking shouldn't come to Illinois. They will not respect the regulations that come with Fracking because they have already proved that they will not.

Sincerely, Gigi Baker 525 S State St Chicago , IL 60605

Though I understand that what you have proposed is just a draft, even drafts should have sources and consult the science behind this environmentally harmful and stressful process. The papers I mentioned that I am currently writing for a few finals require several steps. First, I have to choose a topic (this is easy for you since the topic of hydraulic fracturing has “been assigned” to you). Next, I have to brainstorm how I am going to go about writing my paper including: what points I want to convey, what side I am taking (if it is an argumentative paper), how I am going to convey the points I am making, etcetera. Then there is the outline: I have to structure my paper in an outline format, consider what sources I am going to use, and transition my paper between sections to allow a flow easy for the reader to follow. The first draft comes next. This is basically my whole paper, with perhaps a few improvements to be made along the way. Ultimately, it follows the format of my proposed outline and it includes all the sources I have collected and found appropriate to be implemented into my paper. Several drafts may occur until, finally, I find my paper to be adequate enough to be turned in and graded! Again, I understand that these proposed rules are just a draft, but it seems to me that it is a very insufficient first draft especially because it does not include “sources of underlying data, resources, etc”. How can you hope to construct a document such as this without such sources? Everything you have proposed should be thrown out because it has not consulted studies. This is of course the main point I am making. However, the only reason that I can assume your rules and regulations are so ill prepared is that you must have preferred to get assigned the other side of this topic. You are proposing rules and regulations so that hydraulic fracturing can start taking place in Illinois, but perhaps it would have been easier for you to write about why it should not be coming to Illinois, I am sure you would have found plenty of sources on that!

Sincerely, Lou Bass Richton Park , IL 60471

WE ARE HALFWAY THROUGH THE COMMENT PERIOD!! Thank you--all of you--who have submitted comments. We wish we could tell you that we've run out of things that are wrong with the Rules, but as we work our way through them, we are sadly finding many things that pose risks to public health and safey. So keep your comments coming. Section 1-35 (f) of the Law states that the applicant must certify, “under penalty of perjury that the application is true, accurate, and complete.” Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn’t stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department’s 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn't stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. Revisions Needed: This section should provide that the Department's 60-day review period does not begin until the application is deemed complete by the Department. This would be allowable under the law as the law affords applicants the option of waiving the 60 days on its own accord or at the request of the Department. If the Department finds the application to be incomplete, it could (and should) request the applicant waive the 60 day requirement, commencing it only after the application deficiency is cured. Failure by the applicant to comply with this request should be viewed by the Department as grounds for rejecting the application and denying the permit. The public comment period would, simultaneously be postponed to match the new timeframe.

Sincerely, Bruce Anderson Rolling Meadows, IL 60008

Section 245.230 Permit Application Receipt and Department Review

WE ARE HALFWAY THROUGH THE COMMENT PERIOD!! Thank you--all of you--who have submitted comments. We wish we could tell you that we've run out of things that are wrong with the Rules, but as we work our way through them, we are sadly finding many things that pose risks to public health and safey. So keep your comments coming. Section 1-35 (f) of the Law states that the applicant must certify, "under penalty of perjury that the application is true, accurate, and complete." Subsection 245.230(d) & (e) of the Rules gives the Department 60 days to review and approve or reject the permit. If, during that time, the Department deems the application is NOT complete, it is to notify the applicant in writing of the deficiencies and allow the applicant to correct them. But it doesn't stop the 60-day clock from ticking. This is important because the 60-day review period runs parallel to the period of time the public has to prepare for a public hearing. The rules, as written, invite abuse by unscrupulous applicants who could submit incomplete applications and withhold permit information until late in the process, thereby cheating the public out of valuable time needed to review the application and prepare for a hearing. In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

245.270.i states that parties requesting the public hearing and, if applicable, petitioning to participate in the public hearing shall have the burden of establishing the validity of their objections and concerns through the introduction of credible evidence. The standard of proof is the preponderance of the evidence. The provision concerning burden of proof in this subsection does not make sense in context. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

Sincerely, Abby Dompke Chicago, IL 60607

The standard of proof is the preponderance of the evidence. The provision concerning burden of proof in this subsection does not make sense in context. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

Sincerely, Alonzo Cummins Chicago, IL 60612

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

245.270.i states that parties requesting the public hearing and, if applicable, petitioning to participate in the public hearing shall have the burden of establishing the validity of their objections and concerns through the introduction of credible evidence. The standard of proof is the preponderance of the evidence. The provision concerning burden of proof in this subsection does not make sense in context. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

Sincerely, Bruce Anderson Rolling Meadows, IL 60008

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

245.270.i states that parties requesting the public hearing and, if applicable, petitioning to participate in the public hearing shall have the burden of establishing the validity of their objections and concerns through the introduction of credible evidence. The standard of proof is the preponderance of the evidence. The provision concerning burden of proof in this subsection does not make sense in context. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

Sincerely, Gadrel Williams Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

245.270.i states that parties requesting the public hearing and, if applicable, petitioning to participate in the public hearing shall have the burden of establishing the validity of their objections and concerns through the introduction of credible evidence. The standard of proof is the preponderance of the evidence. The provision concerning burden of proof in this subsection does not make sense in context. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

Section 245.270 Public Hearings

245.270.i states that parties requesting the public hearing and, if applicable, petitioning to participate in the public hearing shall have the burden of establishing the validity of their objections and concerns through the introduction of credible evidence. The standard of proof is the preponderance of the evidence. The provision concerning burden of proof in this subsection does not make sense in context. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

Sincerely, Jonny Gill Chicago, IL 60605

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

245.270.i states that parties requesting the public hearing and, if applicable, petitioning to participate in the public hearing shall have the burden of establishing the validity of their objections and concerns through the introduction of credible evidence. The standard of proof is the preponderance of the evidence. The provision concerning burden of proof in this subsection does not make sense in context. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

Sincerely, Mansi Kathuria Chicago, IL 60647

Section 245.270 Public Hearings

245.270.i states that parties requesting the public hearing and, if applicable, petitioning to participate in the public hearing shall have the burden of establishing the validity of their objections and concerns through the introduction of credible evidence. The standard of proof is the preponderance of the evidence. The provision concerning burden of proof in this subsection does not make sense in context. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

Sincerely, Paul Papoutzz Chicago, IL 60637

245.270.i states that parties requesting the public hearing and, if applicable, petitioning to participate in the public hearing shall have the burden of establishing the validity of their objections and concerns through the introduction of credible evidence. The standard of proof is the preponderance of the evidence. The provision concerning burden of proof in this subsection does not make sense in context. In fact, it reverses the burden that otherwise applies to permit applicants; it is the permit applicant who must demonstrate that they are entitled to a permit. It should not be the hearing requestor's burden to prove that the issues they raise are worthy of consideration. To the extent that the person or persons requesting the hearing raise legitimate questions as to whether a permit should be issued—or issued with particular conditions—it must be the applicant's responsibility to address those questions to the satisfaction of the Department.

Sincerely, Sloane Moore River Forest, IL 60305

Section 245.270 Public Hearings

According to Earthworksaction.org: "Hydraulic fracturing - What it is Geologic formations may contain large quantities of oil or gas, but have a poor flow rate due to low permeability, or from damage or clogging of the formation during drilling. This is particularly true for tight sands, shales and coalbed methane formations. Hydraulic fracturing (aka fracking, which rhymes with cracking) stimulates wells drilled into these formations, making profitable otherwise prohibitively expensive extraction. Within the past decade, the combination of hydraulic fracturing with horizontal drilling has opened up shale deposits across the country and brought large-scale natural gas drilling to new regions. The fracking process occurs after a well has been drilled and steel pipe (casing) has been inserted in the well bore. The casing is perforated within the target zones that contain oil or gas, so that when the fracturing fluid is injected into the well it flows through the perforations into the target zones. Eventually, the target formation will not be able to absorb the fluid as quickly as it is being injected. At this point, the pressure created causes the formation to crack or fracture. Once the fractures have been created, injection ceases and the fracturing fluids begin to flow back to the surface. Materials called proppants (e.g., usually sand or ceramic beads), which were injected as part of the frac fluid mixture, remain in the target formation to hold open the fractures. Typically, a mixture of water, proppants and chemicals is pumped into the rock or coal formation. There are, however, other ways to fracture wells. Sometimes fractures are created by injecting gases such as propane or nitrogen, and sometimes acidizing occurs simultaneously with fracturing. Acidizing involves pumping acid (usually hydrochloric acid), into the formation to dissolve some of the rock material to clean out pores and enable gas and fluid to flows more readily into the well. Some studies have shown that anywhere from 20-85% of fracking fluids may remain underground. Used fracturing fluids that return to the surface are often referred to as flowback, and these wastes are typically stored in open pits or tanks at the well site prior to disposal. Hydraulic fracturing - Issues and impacts The process of fracturing a well is far from benign. The following sections provide an overview of some of the issues and impacts related to this well stimulation technique. Fracking operation, Grass Mesa, Colorado. Photo Credit: Peggy Utesch. Fracking operation, Grass Mesa, Colorado. Photo Credit: Peggy Utesch. Water use Sand and proppants Toxic chemicals Health concerns Surface water and soil contamination Groundwater contamination Air quality Waste disposal Chemical disclosure Water Use In 2010, the U.S. Environmental Protection Agency estimated that 70 to 140 billion gallons of water are used to fracture 35,000 wells in the United States each year. This is approximately the annual water consumption of 40 to 80 cities each with a population of 50,000. Fracture treatments in coalbed methane wells use from 50,000 to 350,000 gallons of water per well, while deeper horizontal shale wells can use anywhere from 2 to 10 million gallons of water to fracture a single well. The extraction of so much water for fracking has raised concerns about the ecological impacts to aquatic resources, as well as dewatering of drinking water aquifers. It has been estimated that the transportation of a million gallons of water (fresh or waste water) requires 200 truck trips. Thus, not only does water used for hydraulic fracturing deplete fresh water supplies and impact aquatic habitat,

the transportation of so much water also creates localized air quality, safety and road repair issues. Sand and Proppants Conventional oil and gas wells use, on average, 300,000 pounds of proppant, coalbed fracture treatments use anywhere from 75,000 to 320,000 pounds of proppant and shale gas wells can use more than 4 million pounds of proppant per well. Frac sand mines are springing up across the country, from Wisconsin to Texas, bringing with them their own set of impacts. Mining sand for proppant use generates its own range of impacts, including water consumption and air emissions, as well as potential health problems related to crystalline silica. Toxic Chemicals In addition to large volumes of water, a variety of chemicals are used in hydraulic fracturing fluids. The oil and gas industry and trade groups are quick to point out that chemicals typically make up just 0.5 and 2.0% of the total volume of the fracturing fluid. When millions of gallons of water are being used, however, the amount of chemicals per fracking operation is very large. For example, a four million gallon fracturing operation would use from 80 to 330 tons of chemicals.[1] As part of New York State's Draft Supplemental Generic Environmental Impact Statement (SGEIS) related to Horizontal Drilling and High-Volume Hydraulic Fracturing in the Marcellus Shale, the Department of Environmental Conservation complied a list of chemicals and additives used during hydraulic fracturing. The table below provides examples of various types of hydraulic fracturing additives proposed for use in New York. Chemicals in brackets [ ] have not been proposed for use in the state, but are known to be used in other states or shale formations. ADDITIVE TYPE DESCRIPTION OF PURPOSE EXAMPLES OF CHEMICALS Proppant "Props" open fractures and allows gas / fluids to flow more freely to the well bore. Sand [Sintered bauxite; zirconium oxide; ceramic beads] Acid Cleans up perforation intervals of cement and drilling mud prior to fracturing fluid injection, and provides accessible path to formation. Hydrochloric acid (HCl, 3% to 28%) or muriatic acid Breaker Reduces the viscosity of the fluid in order to release proppant into fractures and enhance the recovery of the fracturing fluid. Peroxydisulfates Bactericide / Biocide Inhibits growth of organisms that could produce gases (particularly hydrogen sulfide) that could contaminate methane gas. Also prevents the growth of bacteria which can reduce the ability of the fluid to carry proppant into the fractures. Gluteraldehyde; 2-Bromo-2-nitro-1,2-propanediol Buffer / pH Adjusting Agent Adjusts and controls the pH of the fluid in order to maximize the effectiveness of other additives such as crosslinkers. Sodium or potassium carbonate; acetic acid Clay Stabilizer / Control Prevents swelling and migration of formation clays which could block pore spaces thereby reducing permeability. Salts (e.g., tetramethyl ammonium chloride) [Potassium chloride] Corrosion Inhibitor Reduces rust formation on steel tubing, well casings, tools, and tanks (used only in fracturing fluids that contain acid). Methanol; ammonium bisulfate for Oxygen Scavengers Crosslinker The fluid viscosity is increased using phosphate esters combined with metals. The metals are referred to as crosslinking agents. The increased fracturing fluid viscosity allows the fluid to carry more proppant into the fractures. Potassium hydroxide; borate salts Friction Reducer Allows fracture fluids to be injected at optimum rates and pressures by minimizing friction. Sodium acrylate-acrylamide copolymer; polyacrylamide (PAM); petroleum distillates Gelling Agent Increases fracturing fluid viscosity, allowing the fluid to carry more proppant into the fractures. Guar gum; petroleum distillate Iron Control Prevents the precipitation of carbonates and sulfates (calcium carbonate, calcium sulfate, barium sulfate) which could plug off the formation. Ammonium chloride; ethylene glycol; polyacrylate Solvent Additive which is soluble in oil, water & acid-based treatment fluids

which is used to control the wettability of contact surfaces or to prevent or break emulsions. Various aromatic hydrocarbons Surfactant Reduces fracturing fluid surface tension thereby aiding fluid recovery. Methanol; isopropanol; ethoxylated alcohol Many fracturing fluid chemicals are known to be toxic to humans and wildlife, and several are known to cause cancer. Potentially toxic substances include petroleum distillates such as kerosene and diesel fuel (which contain benzene, ethylbenzene, toluene, xylene, naphthalene and other chemicals); polycyclic aromatic hydrocarbons; methanol; formaldehyde; ethylene glycol; glycol ethers; hydrochloric acid; and sodium hydroxide. Very small quantities of some fracking chemicals are capable of contaminating millions of gallons of water. According to the Environmental Working Group, petroleum-based products known as petroleum distillates such as kerosene (also known as hydrotreated light distillates, mineral spirits, and a petroleum distillate blends) are likely to contain benzene, a known human carcinogen that is toxic in water at levels greater than five parts per billion (or 0.005 parts per million). Other chemicals, such as 1,2-Dichloroethane are volatile organic compounds (VOCs). Volatile organic constituents have been shown to be present in fracturing fluid flowback wastes at levels that exceed drinking water standards. For example, testing of flowback samples from Pennsylvania have revealed concentrations of 1,2-Dichloroethane as high as 55.3 micrograms per liter, which is more than 10 times EPA's Maximum Contaminant Level for 1,2-Dichloroethane in drinking water. VOCs not only pose a health concern while in the water, the volatile nature of the constituents means that they can also easily enter the air. According to researchers at the University of Pittsburgh's Center for Healthy Environments and Communities, organic compounds brought to the surface in the fracturing flowback or produced water often go into open impoundments (frac ponds), where the volatile organic chemicals can offgas into the air. When companies have an excess of unused hydraulic fracturing fluids, they either use them at another job or dispose of them. Some Material Safety Data Sheets (MSDSs) include information on disposal options for fracturing fluids and additives. The table below summarizes the disposal considerations that the company Schlumberger Technology Corp. ("Schlumberger") includes in its MSDSs.[2] Schlumberger Fracking Waste Disposal Chart As seen in the table, Schlumberger recommends that many fracturing fluid chemicals be disposed of at hazardous waste facilities. Yet these same fluids (in diluted form) are allowed to be injected directly into or adjacent to USDWs. Under the Safe Drinking Water Act, hazardous wastes may not be injected into USDWs. Moreover, even if hazardous wastes are decharacterized (for example, diluted with water so that they are rendered nonhazardous), wastes must still be injected into a formation that is below the USDW. Clearly, some hydraulic fracturing fluids contain chemicals deemed to be "hazardous wastes." Even if these chemicals are diluted it is unconscionable that EPA is allowing these substances to be injected directly into underground sources of drinking water. Health Concerns Human exposure to fracking chemicals can occur by ingesting chemicals that have spilled and entered drinking water sources, through direct skin contact with the chemicals or wastes (e.g., by workers, spill responders or health care professionals), or by breathing in vapors from flowback wastes stored in pits or tanks. In 2010, Theo Colborn and three co-authors published a paper entitled Natural Gas Operations from a Public Health Perspective. Colborn and her co-authors summarized health effect information for 353 chemicals used to drill and fracture natural gas wells in the United States. Health effects were broken into 12 categories: skin, eye and sensory organ, respiratory, gastrointestinal and liver, brain and nervous

system, immune, kidney, cardiovascular and blood, cancer, mutagenic, endocrine disruption, other, and ecological effects. The chart below illustrates the possible health effects associated with the 353 natural gas-related chemicals for which Colborn and her co-authors were able to gather health-effects data. Colborn's paper provides a list of 71 particularly nasty drilling and fracturing chemicals, i.e., those that are associated with 10 or more health effects. Natural gas drilling and hydraulic fracturing chemicals with 10 or more health effects • 2,2',2"-Nitrilotriethanol • 2-Ethylhexanol • 5-Chloro-2-methyl-4-isothiazolin-3-one • Acetic acid • Acrolein • Acrylamide (2-propenamide) • Acrylic acid • Ammonia • Ammonium chloride • Ammonium nitrate • Aniline • Benzyl chloride • Boric acid • Cadmium • Calcium hypochlorite • Chlorine • Chlorine dioxide • Dibromoacetonitrile 1 • Diesel 2 • Diethanolamine • Diethylenetriamine • Dimethyl formamide • Epidian • Ethanol (acetylenic alcohol) • Ethyl mercaptan • Ethylbenzene • Ethylene glycol • Ethylene glycol monobutyl ether (2-BE) • Ethylene oxide • Ferrous sulfate • Formaldehyde • Formic acid • Fuel oil #2 • Glutaraldehyde • Glyoxal • Hydrodesulfurized kerosene • Hydrogen sulfide • Iron • Isobutyl alcohol (2-methyl-1-propanol) • Isopropanol (propan-2-ol) • Kerosene • Light naphthenic distillates, hydrotreated • Mercaptoacidic acid • Methanol • Methylene bis(thiocyanate) • Monoethanolamine • NaHCO3 • Naphtha, petroleum medium aliphatic • Naphthalene • Natural gas condensates • Nickel sulfate • Paraformaldehyde • Petroleum distillate naptha • Petroleum distillate/ naphtha • Phosphonium, tetrakis(hydroxymethyl)-sulfate • Propane-1,2-diol • Sodium bromate • Sodium chlorite (chlorous acid, sodium salt) • Sodium hypochlorite • Sodium nitrate • Sodium nitrite • Sodium sulfite • Styrene • Sulfur dioxide • Sulfuric acid • Tetrahydro-3,5-dimethyl-2H-1,3,5-thiadiazine-2-thione (Dazomet) • Titanium dioxide • Tributyl phosphate • Triethylene glycol • Urea • Xylene While Colborn and her co-workers focused on chemicals used in natural gas development, the chemicals used to fracture oil wells are very similar or the same. Looking at some of the oil wells that have been developed in the Bakken Shale in North Dakota, the fracturing fluid mixtures include some of the chemicals shown by Colborn to have the potential to cause 10 or more adverse health effects. Information posted hydraulic fracturing fluid chemicals on the FracFocus web site indicates that Bakken Shale oil wells may contain toxic chemicals such as hydrotreated light distillate, methanol, ethylene glycol, 2- butoxyethanol (2-BE), phosphonium, tetrakis(hydroxymethyl)-sulfate (aka phosphonic acid), acetic acid, ethanol, and napthlene.[3] Surface Water and Soil Contamination Spills of fracturing chemicals and wastes during transportation, fracturing operations and waste disposal have contaminated soil and surface waters. This section provides a few examples of spills related to hydraulic fracturing that have led to environmental impacts. Two spills kill fish: In September 2009, Cabot Oil and Gas spilled hydraulic fracturing fluid gel LGC-35 twice at the company's Heitsman gas well. The two incidents released a total of 8,000 gallons of the fracturing fluid, polluting Stevens Creek and resulting in a fish kill. LGC-35, a well lubricant used during the fracturing process. A third spill of LGC-35 occurred a week later, but did not enter the creek. Fracturing fluid taints a high quality watershed: In December 2009, a wastewater pit overflowed at Atlas Resources' Cowden 17 gas well, and an unknown quantity of hydraulic fracturing fluid wastes entered Dunkle Run, a "high quality watershed". The company failed to report the spill. In August 2010 the Pennsylvania Department of Environmental Protection (DEP) levied a $97,350 fine against Atlas Resources Another fracturing fluid spill impacts a high quality waterway: In May 2010, Range Resources was fined was fined $141,175 for failing to immediately notify the

Pennsylvania Department of Environmental Protection when the company spilled 250 barrels of diluted fracturing fluids due to a broken joint in a transmission line. The fluids flowed into an unnamed tributary of Brush Run, killing at least 168 fish, salamanders and frogs. The watercourse is designated as a warm-water fishery under Pennsylvania's special protection waters program. Fracturing fluids affect soil and irrigation ditch: In October 2005 a valve on the wellhead of a Kerr-McGee well in Colorado failed. As a result, between168 and 210 gallons of flowback fluids sprayed into the air and drifted offsite, primarily onto pasture land, resulting in a visible coating that was as much as 1/2 inch thick. Groundwater Contamination As mentioned previously, hydraulic fracturing is used in many coalbed methane (CBM) production areas. Some coal beds contain groundwater of high enough quality to be considered underground sources of drinking water (USDWs). EPA list of chemicals in fracking fluids from 2002 draft of fracking study. Chemicals in fracking fluids. Source: EPA Click to view larger version In 2004, the U.S. Environmental Protection Agency (EPA) released a final study on Evaluation of Impacts to Underground Sources of Drinking Water by Hydraulic Fracturing of Coalbed Methane Reservoirs. In the study, EPA found that ten out of eleven CBM basins in the U.S. are located, at least in part, within USDWs. Furthermore, the EPA determined that in some cases, hydraulic fracturing chemicals are injected directly into USDWs during the course of normal fracturing operations. (Read Laura Amos's story to learn how hydraulic fracturing has affected her family's life.) Calculations performed by EPA in the draft version of its study show that at least nine hydraulic fracturing chemicals may be injected into or close to USDWs at concentrations that pose a threat to human health. The chart below is a reproduction of the data from the EPA draft study. As seen in the chart, chemicals may be injected at concentrations that are anywhere from 4 to almost 13,000 times the acceptable concentration in drinking water. Not only does the injection of these chemicals pose a short-term threat to drinking water quality, it is quite possible that there could be long-term negative consequences for USDWs from these fracturing fluids. According to the EPA study, studies conducted by the oil and gas industry, and interviews with industry and regulators, 20 to 85% of fracturing fluids may remain in the formation, which means the fluids could continue to be a source of groundwater contamination for years to come. The potential long-term consequences of dewatering and hydraulic fracturing on water resources have been summed up by professional hydrogeologist who spent 32 years with the U.S. Geological Survey: At greatest risk of contamination are the coalbed aquifers currently used as sources of drinking water. For example, in the Powder River Basin (PRB) the coalbeds are the best aquifers. CBM production in the PRB will destroy most of these water wells; BLM predicts drawdowns...that will render the water wells in the coal unusable because the water levels will drop 600 to 800 feet. The CBM production in the PRB is predicted to be largely over by the year 2020. By the year 2060 water levels in the coalbeds are predicted to have recovered to within 95% of their current levels; the coalbeds will again become useful aquifers. However, contamination associated with hydrofracturing in the basin could threaten the usefulness of the aquifers for future use. As mentioned previously, anywhere from 20-85% of fracking fluids remain in the ground. Some fracturing gels remain stranded in the formation, even when companies have tried to flush out the gels using water and strong acids. Also, studies show that gelling agents in hydraulic fracturing fluids decrease the permeability of coals, which is the opposite of what hydraulic fracturing is supposed to do (i.e., increase the permeability of the coal formations). Other similar, unwanted side

effects from water- and chemical-based fracturing include: solids plugging up the cracks; water retention in the formation; and chemical reactions between the formation minerals and stimulation fluids. All of these cause a reduction in the permeability in the geological formations. For more details on the studies that have looked at stranded fracturing fluids and the potential for hydraulic fracturing to affect underground sources of drinking water, see Our Drinking Water at Risk, Oil and Gas Accountability Project's review of the EPA's study on the impacts of hydraulic fracturing of coalbed methane reservoirs on drinking water. Air Quality In many oil and gas producing regions, there has been a degradation of air quality as drilling increases. For example, in Texas, high levels of benzene have been measured in the air near wells in the Barnett Shale gas fields. These volatile air toxics may be originating from a variety of gas-field source such as separators, dehydrators, condensers, compressors, chemical spills, and leaking pipes and valves. Increasingly, research is being conducted on the potential air emissions released during the fracturing flow back stage, when wastewater returns to the surface. Shales contain numerous organic hydrocarbons, and additional chemicals are injected underground during shale gas drilling, well stimulation (e.g., hydraulic fracturing), and well workovers. The Pittsburgh University Center for Healthy Environments and Communities (CHEC) has been examining how organic compounds in the shale can be mobilized during fracturing and gas extraction processes. According to the CHEC researchers, these organic compounds are brought to the surface in the fracturing flowback or produced water, and often go into open impoundments (frac ponds), where the waste water, “will offgas its organic compounds into the air. This becomes an air pollution problem, and the organic compounds are now termed Hazardous Air Pollutants (HAP’s).” The initial draft of the New York draft supplemental environmental impacts statement related to drilling in the Marcellus Shale (which is no longer available on-line) included information on modeling of potential air impacts from fracturing fluid wastes stored in centralized impoundments. One analysis looked at the volatile organic compound methanol, which is known to be present in fracturing fluids such as surfactants, cross-linkers, scale inhibitors and iron control additives. The state calculated that a centralized fracturing flowback waste impoundment serving 10 wells (5 million gallons of flowback per well) could have an annual emission of 32.5 tons of methanol. The U.S. EPA reports that “chronic inhalation or oral exposure to methanol may result in headache, dizziness, giddiness, insomnia, nausea, gastric disturbances, conjunctivitis, visual disturbances (blurred vision), and blindness in humans.” Open pits, tanks or impoundments that accept flowback wastes from one well would have a much smaller emission of volatile organic compounds (VOC) like methanol than facilities accepting wastes from multiple wells. But there are centralized flowback facilities like those belonging to Range Resources in Washington County, Pennsylvania that have been designed for “long-term use,” and thus, are likely to accept wastes from more than one well. New York’s air modeling further suggested that the emission of Hazardous Air Pollutants (HAPs) from centralized flowback impoundments could exceed ambient air thresholds 1,000 meters (3,300 feet) from the impoundment, and could cause the impoundment to qualify as a major source of HAPs. Methanol is just one of the VOCs contained in flowback water. The combined emissions from all VOCs present in flowback stored at centralized impoundments could be very large, depending on the composition of the fracturing fluids used at the wells. Data released on flowback water from wells in Pennsylvania reveal that numerous volatile organic chemicals are returning to the surface, sometime in high concentrations.

The Pennsylvania Department of Environmental Protection looked for 70 volatile organic compounds in flowback, and 27 different chemicals showed up. In a health effects analysis conducted by Theo Colborn and others, 37% of the chemicals used during natural gas drilling, fracturing and production (for which health data were available) were found to be volatile, with the ability to become airborne. Colborn and her co-authors compared the potential health impacts of volatile chemicals with those chemicals more like to be found in water (i.e., chemicals with high solubilities). They found that “far more of the volatile chemicals (81%) can cause harm to the brain and nervous system. Seventy one percent of the volatile chemicals can harm the cardiovascular system and blood, and 66% can harm the kidneys,” producing a profile that “displays a higher frequency of health effects than the water soluble chemicals.” The researchers add that the chance of exposures to volatile chemicals are increased by case they can be inhaled, ingested and absorbed through the skin. Citizens of the gas field are experiencing health effects related to volatile chemicals from pits. In 2005, numerous Colorado residents experienced severe odors and health impacts related to flowback and drilling pits and tanks in Garfield County. According to Dion and Debbie Enlow complained to the Colorado Oil and Gas Conservation Commission about odors from a Barrett wellpad upwind from their home. The pad had four wells that were undergoing completion/hydraulic fracturing. Dion Enlow complained to the company that the smell was so bad that "I can't go outside and breathe." In Pennsylvania, a fracturing flowback wastewater pit just beyond June Chappel’s property line created odors similar to gasoline and kerosene, which forced her inside, left a greasy film on her windows, on one occasion created a white dust that fell over her yard. Chappel and her neighbors lived with the noxious odors until they hired an attorney and Range Resources agreed to remove the impoundment. In March 2010, a fracturing flowback wastewater impoundment in Washington County, Pennsylvania caught fire and exploded producing a cloud of thick, black smoke that could be seen miles away. For several days prior to the explosion nearby citizens had tried to alert state officials about noxious odors from the impoundment that were sickening their families, but “their voicemail boxes were full.” Waste Disposal It has been reported that anywhere from 25 – 100% of the chemical-laced hydraulic fracturing fluids return to the surface from Marcellus Shale operations. This means that for some shale gas wells, millions of gallons of wastewater are generated, and require either treatment for re-use, or disposal. In 2009, the volume of fracturing flowback and brines produced in Pennsylvania was estimated to be 9 million gallons of wastewater per day, and this figure was expected to increase to 19 - 20 million gallons/day in 2011. The sheer volume of wastes, combined with high concentrations of certain chemicals in the flowback from fracturing operations, are posing major waste management challenges for the Marcellus Shale states. Also, the US Geological Survey has found that flowback may contain a variety of formation materials, including brines, heavy metals, radionuclides, and organics, which can make wastewater treatment difficult and expensive. According to an article in ProPublica, New York City’s Health Department has raised concerns about the concentrations of radioactive materials in wastewater from natural gas wells. In a July, 2009 letter obtained by ProPublica, the Department wrote that “Handling and disposal of this wastewater could be a public health concern.” The letter also mentioned that the state may have difficulty disposing of the waste, that thorough testing will be needed at water treatment plants, and that workers may need to be monitored for radiation as much as they might be at nuclear facilities. Options for disposal of radioactive flowback or

produced water include underground injection in Class II UIC wells and offsite treatment. The U.S. Environmental Protection Agency has indicated that Class II UIC injection disposal wells are uncommon in New York, and existing wells aren't licensed to receive radioactive waste. In terms of offsite treatment, it is not known if any of New York's water treatment facilities are capable of handling radioactive wastewater. ProPublica contacted several plant managers in central New York who said they could not take the waste or were not familiar with state regulations. Pennsylvania state regulators and the natural gas industry are also facing challenges regarding how to ensure proper disposal of the millions of gallons of chemical-laced wastewater generated daily from hydraulic fracturing and gas production in the Marcellus shale. Drinking water treatment facilities in Pennsylvania are not equipped to treat and remove many flowback contaminants, but rather, rely on dilution of chlorides, sulfates and other chemicals in surface waters used for drinking water supplies. During the fall of 2008, the disposal of large volumes of flowback and produced water at publicly owned treatment works (POTWs) contributed to high total dissolved solids (TDS) levels measured in Pennsylvania's Monongahela River and its tributaries. Studies showed that in addition to the Monongahela River, many of the other rivers and streams in Pennsylvania had a very limited ability to assimilate additional TDS, sulfate and chlorides, and that the high concentrations of these constituents were harming aquatic communities. Research by Carnegie Mellon University and Pittsburgh Water and Sewer Authority experts suggests that the natural gas industry has contributed to elevated levels of bromide in the Allegheny and Beaver Rivers. Bromides react with disinfectants used by municipal treatment plants to create brominated trihalomethanes, which have been linked to several types of cancer and birth defects. In August of 2010, Pennsylvania enacted new rules limiting the discharge of wastewater from gas drilling to 500 milligrams per liter of total dissolved solids (TDS) and 250 milligrams per liter for chlorides. The number of municipal facilities allowed to take drilling and fracking wastewater has dropped from 27 in 2010 to 15 in 2011. Disposal of drilling and fracking waste water is going to continue to present a challenge to local and state governments as more wells are developed across the country. Chemical Disclosure One potentially frustrating issue for surface owners is that it has not been easy to find out what chemicals are being used during the hydraulic fracturing operations in your neighborhood. According to the Natural Resources Defense Council, in the late 1990s and early 2000s attempts by various environmental and ranching advocacy organizations to obtain chemical compositions of hydraulic fracturing fluids were largely unsuccessful because oil and gas companies refused to reveal this "proprietary information." In the mid-2000s, the Oil and Gas Accountability Project and The Endocrine Disruption Exchange (TEDX) began to compile information on drilling and fracturing chemicals from a number of sources, including Material Safety Data Sheets obtained through Freedom of Information Act requests of state agencies. TEDX subsequently produced reports on the toxic chemicals used in oil and gas development in several western states including Montana, New Mexico, Wyoming and Colorado, and worked with the Environmental Working Group to produce a report on chemicals injected into oil and gas wells in Colorado. In 2006, the first effort to require disclosure of chemicals was launched. In June of 2006, the Oil and Gas Accountability Project submitted a letter to the Colorado Oil and Gas Conservation Commission (COGCC) and the Colorado Department of Public Health and the Environment (CDPHE) on behalf of five citizens organizations in Colorado. The groups asked that state agencies require disclosure

of the chemicals used and monitoring of chemicals and wastes released by the oil and gas industry in Colorado. Since that time the Oil and Gas Accountability Project and others have worked to get disclosure bills passed in states across the country. Wyoming, Arkansas, Pennsylvania, Michigan and Texas now require a certain level of disclosure, although trade secret laws still prevent full disclosure in most states. Hydraulic Fracturing Best Practices From a public health perspective, if hydraulic fracturing stimulation takes place, the best option is to fracture formations using sand and water without any additives, or sand and water with non-toxic additives. Non-toxic additives are be

Dear IDNR, Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. There are some revisions needed. This provision should specify a time window for applicants to provide corrections. It should also provide that the post-hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over. Kurt

Exclusion of Some Fracking Wells Subpart H, Sections 245.830 245.850 The law requires all wastewater to be stored in tanks, and allows use of open pits ONLY for one week and ONLY when unexpectedly large volumes of wastewater come up from the well. The proposed rules, hover require NO accurate calculations for tank size, which means open pits could be come more the norm if they are undersized. They also allow wastewater to sit in open pits until operations are complete. This far exceeds the maximum 7 days allowed by regulations, which were designed to protect people and wildlife from exposure to hazardous chemicals. Revision Needed: Redraft to follow the law.

Fracking & drilling permits must take into account local geology. Southern Illinois is located between two major rivers & is near two potential earthquake faults. Past mining & drilling operations have left most Southern Illinois towns on near areas that are geologically unstable. The cave system in nearby Indiana goes for hundreds of miles. There should be a moratorium on new IL fracking permits in earthquake-prone or or other potentially hazardous disaster areas.

Fracking causes a number of bad and permanent consequences to the environment. It causes pollution of local water supplies with its influx of chemicals, affecting local residents, but possibly other users connected to the same water system. It causes earthquakes that damage people's homes and properties. The bad effects outweigh any good that fracking provides by extracting natural gas. Personally, I'm shocked that this practice is even legal. If it were up to me, I would make it a criminal offense across the board. At the very least, it needs stronger regulation, especially from local authorities.

Fracking is such a horribly messy thing to do -- it degrades the environment, causes pollution, uses an unbelievable amount of water, uses carcinogenic chemicals, likely leaches into ground water, and possibly causes earthquakes due to the force used in doing the "fracking." How in the world can it be a good thing?

How does this affect me: Who is in control Relevant parts of the Proposed Administrative Rules: 245.270 Public Hearings Section 245.330 narrows it's counterpart in the law and also sets up a system that keeps citizens largely in the dark about changes to permits that may well be significant. Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Section 245.270 Public Hearings

I am concerned that the rush to secure short term profits has taken priority over the long term consequences of fracking. The potential for detrimental environmental, local economic, and public health outcomes is alarming, and the proposed rules do not adequately address the high cost of damage to our water supply. Fracking exploits a limited resource for a limited time. The water supply is more important and irreplaceable. We can survive without fracking; we cannot survive without water. Therefore, it is critical that any fracking allowed be limited to seismically stable areas away from water and protected natural areas. Please take the time to develop adequate environmental and safety regulations. The potential for unfixable accidents and contamination is too high to risk our limited natural resources. New energy sources are being found all the time. But no one can create water, which is essential for life. Carol Grom, Sleepy Hollow, IL

Section 245.270 Public Hearings

I don't know about the people who work for IDNR, but in Chicago, if you so much as add a brick to a wall on the building you own, you have to get a building permit. Period. Lord knows if you want to rezone something, that most definitely requires an additional public comment period. Now for the most part, if I want to add a basketball hoop or renovate my kitchen, then chances are the building modifications won't cause a significant amount of danger to my neighborhood or the greater Chicago area. Most businesses are not going to pose serious health risks to a residential area, or vice versa. However, modifications to a fracking operation could pose health risks for an entire community and therefore should require public notification. Certainly the modifications that should prompt a public hearing should not be limited to: 1.moving the well, including the horizontal well bore, 2. adding new horizontal well bores, or 3. adding length to any existing or planned horizontal well bores." These limitations were not included in the Act passed by the General Assembly and were never intended by the statute they passed to regulate the industry, which suggested that a significant deviation from the original permit should prompt a permit modification, including public notification, commenting, and hearings. Clearly "significant deviation" should be defined, and the definition should be: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." Any specific examples of significant deviations described in the rules should be framed non-exclusively, i.e., employing the language "including but not limited to...." Communities absolutely should be informed of any deviation from the original fracking permit and should be provided with additional opportunity to comment publicly.

Section 245.270 Public Hearings

In Chicago, when the CTA wants to make major changes, they offer multiple hearings all over the city, so as to provide the people who use the CTA the opportunity to share their concerns. UIC's public hearings occur on all of their campuses. The CTA doesn't have hearings in Naperville just because maybe the employees live there. UIC doesn't have public meetings in DeKalb. That would be absurd. So why would a public hearing regarding a fracking operator's permit application occur outside of the community implicated by the application???? Section 245.270(b)(2) of the rules does not require that IDNR hold hearings for permit applications in counties that would be affected by the fracking operations for which the permit was applied. If the purpose of a hearing is to provide the public an opportunity to comment on and ask questions about a permit, why would you hold the hearing outside of the community in question? This makes no sense. Certainly if it is inconvenient for IDNR representatives to travel to the communities implicated by fracking permit applications, then certainly it is completely unreasonable to expect community members to travel great distances to voice their concerns in an area outside of their community. Thus permit application hearings should all be held in the county where the well for which the permit has been applied is to be located.

In many states "home-rule" of resources has been negated. The resources beneath a person's home are no longer owned by the person purchasing the home, but are being held onto by the builders - and later sold for $ to oil and gas industries. Here is an article that discusses this issue: http://www.reuters.com/article/2013/10/09/us-usa-frackingrights- specialreport-idUSBRE9980AZ20131009 What type of safeguards are there being taken in the state of Illinois to ensure that a homeowner's land-value -- and home-values -- will be protected against such exploitation by builders and natural gas developers.

Sincerely, Judy Cummings Evanston, IL 60201

Liability / Burden of Proof Supart F, Section 245.620 The law presumes that water pollution found within 1500 feet of a tracking operation was caused by tracking (in other words, the burden lies on the tracking operator, not the person(s) impacted by the pollution to prove that the pollution came from any other sources. However, the rules limit the presumption to a much smaller set of "indicator" chemicals, rather than the list of more than 100 chemicals included in the law. This inappropriately favors the operator by placing the burden squarely on those affected in the event that the presence of one of the chemicals no longer listed is found. Revision needed: Modify the rules to follow the adopted law.

Sincerely, Pamela J. Richart 1645 W. Jarvis Chicago, IL 60626

Section 245.270 Public Hearings

No permits if a permit applicant fails to appear at a hearing. How does this affect me: Who is in control Relevant parts of the Proposed Administrative Rules: Subpart B: Registration and Permitting Procedures (245.200-245.270)245.270 Public Hearings Section 245.270(f) of the rules allows a permit to be given EVEN IF the applicant has failed to appear at a hearing. This provision would gut the purpose of the public hearing requirement. In the event the failure was due to an emergency or circumstances beyond the applicant's control, the hearing should be rescheduled, and the 60-day time frame should start over to accommodate that rescheduling. If the applicant cannot show good cause for failure to appear at the hearing, the application should be denied. In other court cases, failure to appear either prompts dismissal of a case, or sanctions such as a warrant for arrest, fines and/or jail. An applicant should not be rewarded for failure to appear at a hearing; rather, deny the permit. Deny subsequent applications.

Sincerely, Sabrina Helen Bennett Hardenbergh 1 Hardenbergh Road Carbondale, IL 62902

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Public Notice Subpart C, Section 245.330 The regulations require significant modifications to permit to undergo public review processes, including notice, comment and public hearings. But the rules greatly narrow the type of modifications that require public processes - in other words, they open the door for tracking permit holders to pull a "bait and switch". This already is happening with coal mining in Illinois. Permits are changed (considered insignificant revision) and the public is not notified: One particularly egregious example of this relates to the approval of the injection of coal slurry into The state has already allowed the practice at the Crown Mine No. 3 near Girard, and the owner of the Shay No. 1 Mine near Carlinville - without public notice. The danger is serious enough that the practice of injecting coal slurry into the ground has been curtailed in West Virginia, where more than 100 lawsuits are pending by residents who blame coal companies for poisoning wells. Another example is Deer Run Mine, Deer Run mine where the operator used the Insignificant Permit Revision and Incidental Boundary Revision process to receive approval from IDNR to build the entire base of the High Hazard coal slurry impoundment and begin dumping coal slurry there before any opportunity for public comment, and before the mine received a dam permit from IDNR’s Office of Water Resources. Revision needed - Strengthen the language in the rules so that the public and the natural resource upon which we all depend are protected. Ensure that significant revisions strongly defined to avoid what's already happening in the Illinois coal basin - the same area that is likely to be impacted by hydrofracking.

Sincerely, Pamela J. Richart 1645 W. Jarvis Chicago, IL 60626

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Relevant parts of the Proposed Administrative Rules: Subpart B: Registration and Permitting Procedures (245.200-245.270)245.270 Public Hearings Section 245.270(n) reads "If the hearing decision determines that a valid objection or concern with the permit application exists such that there is a potential impact to the pending permit application, the applicant may attempt to correct the deficiencies and provide the Department any information required to address the valid objection or concern. If the applicant fails to provide adequate supplemental information to address a valid objection or concern, the Department may reject the application condition the permit accordingly. (Section 1-35(j) of the Act)" THE ADOPTED REGULATIONS ARE WEAK AND FAVOR THE APPLICANT. WHY DOESN'T THIS SECTION REQUIRE THE IDNR TO REJECT THE PERMIT IN THE EVENT A VALID OBJECTION OR CONCERN EXISTS AND THE APPLICANT FAILS TO PROVIDE ADEQUATE SUPPLEMENTAL INFORMATION? THE WORD "MAY" IS DISCRETIONARY. REVISION NEEDED: THE WORD "MAY" SHOULD BE REPLACED WITH "SHALL".

Sincerely, Pamela J. Richart 1645 W. Jarvis Chicago, IL 60626

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Relevant parts of the Proposed Administrative Rules: Subpart B: Registration and Permitting Procedures 245.270 Public Hearings Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post-hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Sincerely, Pamela J. Richart 1645 W. Jarvis Chicago, IL 60626

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270 requires the Department to appear at hearings but does not require that the Department testify. The rules should contain an express obligation that the Department testify—and testify under oath—and be available for cross-examination. Without such testimony, a primary purpose of the hearings – to vet the permit application and ensure transparency – is gutted. Revisions Needed: Subsection 245.270(g)(6) should be amended to specify not merely that a representative from the Department appear and "be given an opportunity" to provide evidence, but that the representative "shall testify under oath." Furthermore, considering the specificity the Department requires of citizens at each hearing, the Department must be equally prepared. In other words, the Department must provide a person or persons (with appropriate knowledge of specific areas) who will be able to address any issues that may arise at the hearing.

Sincerely, Adriana Caballero Oak Park, IL 60302

Section 245.270 Public Hearings

Section 245.270 requires the Department to appear at hearings but does not require that the Department testify. The rules should contain an express obligation that the Department testify—and testify under oath—and be available for cross-examination. Without such testimony, a primary purpose of the hearings – to vet the permit application and ensure transparency – is gutted. Revisions Needed: Subsection 245.270(g)(6) should be amended to specify not merely that a representative from the Department appear and "be given an opportunity" to provide evidence, but that the representative "shall testify under oath." Furthermore, considering the specificity the Department requires of citizens at each hearing, the Department must be equally prepared. In other words, the Department must provide a person or persons (with appropriate knowledge of specific areas) who will be able to address any issues that may arise at the hearing.

Sincerely, Rachel Baker Chicago , IL 60625

Section 245.270 Public Hearings

Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Abby Dompke Chicago, IL 60607

It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Angela Li Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Carla Hunter Chicago, IL 60605

But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Donovan Snyder Snyder Chicago, IL 60605

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Grace Pai Chicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, John Hunt Chicago, IL 60641

Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings.Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Keri Curtis Peru, IL 61354

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process.It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings.Solution: Hold all hearings in the county in which a well is to be located.

Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Maddison Davis Chicago, IL 60605

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Section 245.270 Public Hearings

Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Olivia Stovicek Chicago, IL 60637

It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Rebecca Foster Chicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Shrabya Timinsia Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Sincerely, Westin Campo chicago, IL 60608

Section 245.270 Public Hearings

Section 245.270(f) of the rules allows a permit to be given EVEN IF the applicant has failed to appear at a hearing. This provision would gut the purpose of the public hearing requirement. HOW CAN QUESTIONS RAISED BY THE PUBLIC BE MEANINGFULLY ADDRESSED IF THE APPLICANT IS NOT THERE TO HEAR AND RESPOND TO THE QUESTION? ISN'T THAT THE INTENT OF THE PUBLIC HEARING IN THE FIRST PLACE? In the event the failure was due to an emergency or circumstances beyond the applicant's control, the hearing should be rescheduled, and the 60-day time frame should start over to accommodate that rescheduling. If the applicant cannot show good cause for failure to appear at the hearing, the application should be denied.

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270(f) of the rules allows a permit to be given EVEN IF the applicant has failed to appear at a hearing. This provision would gut the purpose of the public hearing requirement. In the event the failure was due to an emergency or circumstances beyond the applicant's control, the hearing should be rescheduled, and the 60-day time frame should start over to accommodate that rescheduling. If the applicant cannot show good cause for failure to appear at the hearing, the application should be denied.

Sincerely, Benjamin Chametzky Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.270(f) of the rules allows a permit to be given EVEN IF the applicant has failed to appear at a hearing. This provision would gut the purpose of the public hearing requirement. In the event the failure was due to an emergency or circumstances beyond the applicant's control, the hearing should be rescheduled, and the 60-day time frame should start over to accommodate that rescheduling. If the applicant cannot show good cause for failure to appear at the hearing, the application should be denied.

Section 245.270(f) of the rules allows a permit to be given EVEN IF the applicant has failed to appear at a hearing. This provision would gut the purpose of the public hearing requirement. In the event the failure was due to an emergency or circumstances beyond the applicant's control, the hearing should be rescheduled, and the 60-day time frame should start over to accommodate that rescheduling. If the applicant cannot show good cause for failure to appear at the hearing, the application should be denied.

Sincerely, Hannah Campbell Gustafson Chicago, IL 60637

Section 245.270 Public Hearings

Section 245.270(f) of the rules allows a permit to be given EVEN IF the applicant has failed to appear at a hearing. This provision would gut the purpose of the public hearing requirement. In the event the failure was due to an emergency or circumstances beyond the applicant's control, the hearing should be rescheduled, and the 60-day time frame should start over to accommodate that rescheduling. If the applicant cannot show good cause for failure to appear at the hearing, the application should be denied.

Sincerely, Matt Chappell Tuscola, IL 61953

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.330 narrows it's counterpart in the law and also sets up a system that keeps citizens largely in the dark about changes to permits that may well be significant. Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Abby Dompke Chicago, IL 60607

While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Ammar Kalimullah Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.330 narrows it's counterpart in the law and also sets up a system that keeps citizens largely in the dark about changes to permits that may well be significant. Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.330 narrows it's counterpart in the law and also sets up a system that keeps citizens largely in the dark about changes to permits that may well be significant. Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Christina Scianna Chicago, IL 60605

Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Eve Zuckerman CHicago, IL 60615

The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, James Wauer Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.330 narrows it's counterpart in the law and also sets up a system that keeps citizens largely in the dark about changes to permits that may well be significant. Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Karina Hendren Chicago, IL 60637

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.330 narrows it's counterpart in the law and also sets up a system that keeps citizens largely in the dark about changes to permits that may well be significant. Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.330 narrows it's counterpart in the law and also sets up a system that keeps citizens largely in the dark about changes to permits that may well be significant. Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Lexington Lawson Chicago, IL 60640

Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Nancy Penney Monticello, IL 61856

Citizens should be informed of these deviations and allowed opportunity for public comment. THIS SUGGESTED CHANGE IS EXTREMELY IMPORTANT, GIVEN THE IDNR OFFICE OF MINEs AND MINERAL'S TRACK RECORD OF DETERMINING REVISIONS ARE INSIGNIFICANT IN INSTANCES WHERE COMMUNITIES OR RESIDENTS ARE AFFECTED. TWO EXAMPLES: 1. THE CONSTRUCTION OF A 80-FOOR TALL, HIGH-HAZARD COAL SLURRY IMPOUNDMENT IN HILLSBORO BY THE CLINE GROUP THAT COVERS ONE SQUARE MILE. THIS IS ADJACENT TO A HOSPITAL, SENIOR LIVING FACILITY AND DAY CARE CENTER; AND THE INJECTION OF COAL SLURRY UNDERGROUND IN NEARBY GIRARD (SAME OPERATOR). RESIDENTS ARE RIGHTLY CONCERNED ABOUT THE PROXIMITY OF THE IMPOUNDMENT TO VULNERABLE POPULATIONS IN THE EVENT THE WALLS SHOULD BREAK. THEY ARE CONCERNED ABOUT LOSS OF LIFE AND PROPERTY. AND THEY REPEATEDLY ASKED WHERE COAL SLURRY WOULD BE STORED DURING THE HEARING PROCESS. 2. THE INJECTION OF COAL SLURRY UNDERGROUND BY THE CLINE GROUP, WHO PLANNED TO GENERATE 750,000 TONS OF CLURRY A YEAR AT FULL PRODUCTION. THIS, TOO, WAS APPROVED AS AN INSIGNIFICANT REVISION. THE PRACTICE OF INJECTING COAL SLURRY UNDERGROUND HAS BEEN BANNED IN WEST VIRGINIA DUE TO ITS HEALTH IMPACTS (AT LEAST TEMPORARILY). CONCERNS INCLUDE CONTAMINATION OF GROUND WATER AND WELLS. THE PUBLIC HAS A RIGHT TO BE INFORMED AND ALLOWED TO COMMENT ON ACTIVITIES THAT AFFECT THEIR LIVES.

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Section 245.330 narrows it's counterpart in the law and also sets up a system that keeps citizens largely in the dark about changes to permits that may well be significant. Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Rachel Katz Chicago, IL 60615

It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Sarah Kindt Chicago, IL 60607
