Section 245.330 narrows it's counterpart in the law and also sets up a system that keeps citizens largely in the dark about changes to permits that may well be significant. Section 1-55(c) of the Act addresses modifications by applicant. It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

It states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The statute does not define what constitutes a "significant deviation," but the draft rules radically circumscribe the term, giving it a narrow and exclusive meaning that is found nowhere in, or supported by, the statute. Specifically, the draft rules define significant deviation only as those modifications that "propose to: move the well, including the horizontal well bore, add new horizontal well bores, or add length to any existing or planned horizontal well bores." While these circumstances would certainly constitute significant deviations, so would many others. For instance, what about a modification calls for significantly more water use or water use from a different source even if the increased use fell short of a "serious risk" to public health or the environment. Revisions Needed: We recommend the NRDC's language to define a significant deviation: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." If specific examples are used to further flesh out this definition, those examples must be framed non-exclusively, i.e., employing the language "including but not limited to...." Citizens should be informed of these deviations and allowed opportunity for public comment.

Sincerely, Tybee McLaughlin Chicago, IL 60605

Section 245.270 Public Hearings

Starting the clock over when deficiencies are identified at, or as a result of, the hearing. How does this affect me: Who is in control Relevant parts of the Proposed Administrative Rules: Subpart B: Registration and Permitting Procedures (245.200-245.270)245.270 Public Hearings Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Sincerely, Sabrina Helen Bennett Hardenbergh 1 Hardenbergh Road Carbondale, IL 62902

Section 245.270 Public Hearings

Subpart B: Registration and Permitting Procedures (245.200-245.270) 245.270 Public Hearings Section 245.270(b)(2) of the Rules gives the Department broad latitude regarding where to hold a hearing, including holding hearings outside the affected counties. It is imperative that the hearings be held IN the county where a well will be located. A location outside the affected county will not serve the public interest. It could create an enormous barrier to participation by ordinary citizens, who may not have the resources, time or child care options for out-of-town travel. Furthermore, out-of-county hearings limit the ability of ordinary citizens to call local witnesses, who may have critical information but be unable or unwilling to come to Springfield. Finally, out of county hearings impede the practicalityfor interested neighbors to attend and observe the hearing, defeating the purpose of ensuring transparency in the permitting process. It should not be difficult to identify locations where hearings can be held in affected counties. Courthouses, schools, and in some cases county board offices or town halls generally have space that could accommodate a hearing. Furthermore, with the availability and low cost of web-based technology, the Department should be able to appear remotely at a hearing being held in the affected county even if travel there is logistically impossible. But we posit that if it is too expensive or inconvenient for the Department to travel to hearings in counties that will be affected, then it is unfeasible to expect ordinary citizens to bear that burden by traveling to off-site counties to testify in hearings. Solution: Hold all hearings in the county in which a well is to be located.

Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Sincerely, Alexandra Lynn Chicago, IL 606

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Sincerely, Christiane Rey 3651 N. Francisco Ave. Chicago, IL 60618

Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Sincerely, Hannah Campbell Gustafson Chicago, IL 60637

As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Sincerely, Ken Buck Naperville, IL 60540

Section 245.270 Public Hearings

Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Sincerely, Min Li Naperville, IL 60564

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Sincerely, Rebecca Foster Chicago, IL 60615

Subsection 245.270(n), allows the applicant to attempt to correct deficiencies identified at the hearing, but places no time limit on such correction. It also doesn't require the Department to provide public notice of such correction. As such, applicants could, in principle, provide information to the Department on Day 59 of the 60-day permit issuance period, and the public would not find out about it until long after the permit had been issued. Revisions Needed: This provision should specify a time window for applicants to provide corrections. It should also provide that the post- hearing public comment period must remain open for a sufficient number of days after that time window in order to provide the public adequate time to meaningfully review and comment on those corrections. It would not be unreasonable for deficiencies to be viewed as an incomplete application requiring that the 60-day clock start over.

Sincerely, Westin Campo chicago, IL 60608

Section 245.270 Public Hearings

The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. This is an inconsistency between the law and the rules. Problem: For a person advocating on his or her own behalf, this additional requirement adds an unnecessary burden that may discourage the robust public participation envisioned by the statue. Revisions Needed: Return to the requirements in the law requiring only a petition to the Department.

Sincerely, Adriana Caballero Oak Park, IL 60302

Revisions Needed: Return to the requirements in the law requiring only a petition to the Department.

Sincerely, Ashley Seymour Chicago, IL 60615

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. This is an inconsistency between the law and the rules. Problem: For a person advocating on his or her own behalf, this additional requirement adds an unnecessary burden that may discourage the robust public participation envisioned by the statue. Revisions Needed: Return to the requirements in the law requiring only a petition to the Department.

Sincerely, Ava Benezra Chicago, IL 60615

Section 245.270 Public Hearings

The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. This is an inconsistency between the law and the rules. Problem: For a person advocating on his or her own behalf, this additional requirement adds an unnecessary burden that may discourage the robust public participation envisioned by the statue. Revisions Needed: Return to the requirements in the law requiring only a petition to the Department.

Sincerely, Elias Friedman Chicago, IL 60605

Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. This is an inconsistency between the law and the rules. Problem: For a person advocating on his or her own behalf, this additional requirement adds an unnecessary burden that may discourage the robust public participation envisioned by the statue. Revisions Needed: Return to the requirements in the law requiring only a petition to the Department.

Sincerely, jd paulus wheaton, IL 60187

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. Section 245.270 Public Hearings

The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. This is an inconsistency between the law and the rules. Problem: For a person advocating on his or her own behalf, this additional requirement adds an unnecessary burden that may discourage the robust public participation envisioned by the statue. Revisions Needed: Return to the requirements in the law requiring only a petition to the Department.

Sincerely, Kevin Casto Chicago, IL 60615

We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. This is an inconsistency between the law and the rules. Problem: For a person advocating on his or her own behalf, this additional requirement adds an unnecessary burden that may discourage the robust public participation envisioned by the statue. Revisions Needed: Return to the requirements in the law requiring only a petition to the Department.

Sincerely, Marissa Godlewski Carbondale, IL 62901

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. Sincerely, Norma Claire Moruzzi Chicago, IL 60640

In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. This is an inconsistency between the law and the rules. Problem: For a person advocating on his or her own behalf, this additional requirement adds an unnecessary burden that may discourage the robust public participation envisioned by the statue. Revisions Needed: Return to the requirements in the law requiring only a petition to the Department.

Sincerely, Olivia Stovicek Chicago, IL 60637

The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. This is an inconsistency between the law and the rules. Problem: For a person advocating on his or her own behalf, this additional requirement adds an unnecessary burden that may discourage the robust public participation envisioned by the statue. Revisions Needed: Return to the requirements in the law requiring only a petition to the Department.

Sincerely, Ron Yehoshua Chicago, IL 60637

Section 245.270 Public Hearings

The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 1-50(b) of the Hydraulic Fracturing Regulatory Act says any person having an interest that is or may be adversely affected [by a fracking permit], can petition the Department for participation in a hearing. But Subsection 245.270(a)(6) of the Rules raises the bar, requiring the request for hearing to be served upon the Hearing Officer, the Department, and the applicant. This is an inconsistency between the law and the rules. Problem: For a person advocating on his or her own behalf, this additional requirement adds an unnecessary burden that may discourage the robust public participation envisioned by the statue. In reference to Subpart B: Registration and Permitting Procedures

Section 245.270 Public Hearings

The Illinois General Assembly's fracking regulatory act provides for the means by which anyone who could potentially be affected negatively by a fracking operation to petition for participation in a hearing on the fracking operator's permit application. Section 1- 50(b) of the Hydraulic Fracturing Regulatory Act, it is quite simple: such an individual as who might fear that he/she might negatively be affected by a fracking operation need only petition IDNR for participation in a hearing. But Subsection 245.270(a)(6) of the Rules adds additional and unnecessary bureaucracy, requiring such an individual to petition the hearing officer, the department, and the applicant. This is a major inconsistency between the law and IDNR's rules and may result in reduced public participation in the hearing process--as was intended by the GA's Act. IDNR should follow the letter of the Act and simply require individuals who are or may be affected by a fracking permit application to petition IDNR only for a hearing.

Section 245.270 Public Hearings

This change is ludicrous and places the burden on the public. It is yet one more example of why trying to regulate something as hazardous as hydrofracking, particularly when the extraction of natural resources results in profits by a corporation, isn't going to work. This is a change from the regulations - not an oversight. The Act's provision affording public hearings are critically important to ensuring that the public has the ability to fully understand hydraulic fracturing permits that may affect them, and challenge them if appropriate. We are therefore concerned that some aspects of the draft rules governing hearings could potentially undercut the robust public participation envisioned in the statute. Section 245.270 Public Hearings

To the Illinois Department of Natural Resources, My comment is in regards to defining what a "significant deviation" is. After looking through and digesting what the proposed rules and regulations lay out, it has come to my attention that there is a loophole created when something is vague and/or not properly defined. If and when defining something is left up to the company drilling, ultimately, it can become twisted and defined in multiple ways- with a different definition laid out by each fracking company. Section 1-55(c) of the Act addresses modifications by applicant and states, "If the Department determines that the proposed modifications constitute a significant deviation from the terms of the original application and permit approval, or presents a serious risk to public health, life, property, aquatic life, or wildlife, the Department shall provide the opportunities for notice, comment, and hearing required under Sections 1-45 and 1-50 of this Act." The drafted rules do state and define significant deviation to modifications that "(1) move the well, including the horizontal well bore, (2) Ad d new horizontal well bores, or (3) add length to any existing or planned horizontal well bores." However, there are many other circumstances in which the phrase "significant deviation" can apply! Personally, while I appreciate that the IDNR has taken the time to lay out (3) circumstances in which "significant deviation" does apply, I do not, in any way, shape, or form, understand why the IDNR has limited this so much. Yes, it may take time to list out all the circumstances, but by not doing that you are only leaving loopholes for companies who contort and define things to help benefit them the most in the end. Listing out different circumstances may not be the most effective use of time, but at least coming up with a tight definition would be. I have found the NRDC's way of defining a "significant deviation" to be quite appropriate and a very solid way of defining this phrase: "A permit modification shall be treated as a significant deviation from the original permit if the proposed actions or potential impacts of those actions may differ materially from those associated with the original permit application." Really, it is all in the language and way that something is worded. So if explicit examples are used when defining this term, those examples need to be framed nonexclusively to avoid any confusion, i.e., using such language as "including but not limited to...." It is in my opinion that this use of language/ wording will help avoid any confusion and will allow little room for definition manipulation by these fracking companies looking to increase profit. Please, please consider changing the language in this section of the drafted rules and regulations and consider making this a tighter section that avoids any type of a loophole as a whole. Thank you so much for your time in reading and considering this correction!

Sincerely, Rebecca Quesnell 3 Talisman Trace Galena, IL 61036

Who would benefit from having the hearings away from the people most concerned in an area? The residents who know the local situation and are most touched by the decisions???? Or the company that would call on people not in touch with the real situation???? Why make it harder for the local residents to speak their mind and to bring local residents to speak? The use of web-base technology might help with this problem.

Sincerely, Genarose Buechler Red Bud, IL 62278

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

IDNR's Duties and Responsibilities to Protect the Citizens of Illinois How does this affect me: Health and well-being Relevant parts of the Proposed Administrative Rules: 245.300 Permit Decision In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. Show

Sincerely, Janet McDonnell 1322 North Vail Avenue Arlington Heights, IL 60004

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

IDNR's Duties and Responsibilities to Protect the Citizens of Illinois How does this affect me: Health and well-being Relevant parts of the Proposed Administrative Rules: 245.300 Permit Decision In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Lora Chamberlain 6341 N. Glenwood, 1# Chicago, IL 60660

This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Anica Washington Chicago, IL 60619

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Benjamin Boyajian Chicago, IL 60615

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Brian Menzel Chicago, IL 60608

This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. Personal comment: The fact that the regulations are weaker than the law is an extremely bad sign. It feels that we have already abdicated the state's duty to protect citizens, workers and the environment.

Sincerely, Christiane Rey 3651 N. Francisco Ave. Chicago, IL 60618

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, David Atwood Chicago, IL 60643

Fair Economy Illinois

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Emerson Delgado Chicago, IL 60637

Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Gerry Hoffman Chicago, IL 60657

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, jd paulus wheaton, IL 60187

The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Kaijie Wang Chicago, IL 60615

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Kelsey Chicago, IL 60631

Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Lauren San Juan Chicago, IL 60608

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Mary Trimmer Granite City, IL 62040

Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Nora Helfand Chicago, IL 60637

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Rachael Dompke Belleville, IL 62221

Fair Economy Illinois

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Rebecca Foster Chicago, IL 60615

IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, sam zacher Chicago, IL 60637

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes. There are at least two legislative purposes in the regulatory statute: To allow horizontal fracking in Illinois, To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment. This purpose is set forth explicitly in two places in the regulatory statute--Section 1- 75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules: All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1-53(a)(4) of the legislation states: The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Tommy Talley Chicago, IL 60617

The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not. If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. There have been over 3000 violations in PA since 2009 and they are not minor violations. They involve infractions such as: 224 violations of “Failure to properly store, transport, process or dispose of residual waste. 143 violations of “Discharge of pollutional material to the waters of Commonwealth. 140 violations of “Pit and tanks not constructed with sufficient capacity to contain pollutional substances. The residents of Illinois are depending on IDNR to protect their health, their safety, and the safety of their water, air, and soil. IDNR needs to return the legislation’s intent and mandate that hydraulic fracturing operations will only be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source.

Sincerely, Young-In Chicago, IL 60637

Fair Economy Illinois

In reference to Subpart C: Permit Decisions

Section 245.300 Permit Decision

In Section 1-130 of the regulatory statute, the legislature granted IDNR authority to adopt rules to carry out the legislature's purposes.There are at least two legislative purposes in the regulatory statute:To allow horizontal fracking in Illinois,To approve horizontal fracking conditionally based on the safeguarding of public health and public safety, and the protection of the environment.This purpose is set forth explicitly in two places in the regulatory statute--Section 1-75(a)(2) and Section 1-53(a)(4). IDNR has acknowledged 1-75 verbatim, in Section 245.800(2) of the proposed rules:All phases of high volume horizontal hydraulic fracturing operations shall be conducted in a manner that shall not pose a significant risk to public health, life, property, aquatic life, or wildlife. But IDNR has changed the legislature's language in Section 1-53(a)(4) of the proposed rules, lowering the standard explicitly created by the legislature. Section 1- 53(a)(4) of the legislation states:The Department shall issue a high volume horizontal hydraulic fracturing permit, with any conditions the Department may find necessary, only if the record of decision demonstrates that: the proposed hydraulic fracturing operations will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source. The key phrase there is "will be conducted". Clearly the intent of the statute is that fracking will only be allowed if it is conducted in a safe manner. IDNR's proposed Section 245.300 changes the legislative words "will be conducted" to "as proposed, are reasonably expected to be conducted". This lowers the standard and is inconsistent with the legislature's stated purpose. “Will be conducted” is a mandate; “reasonably expected to be conducted” is not.If hydraulic fracturing outcomes in Illinois mirror effects of other states, we can “reasonably expect” that the industry will cut corners and violate standards. In reference to Subpart C: Permit Decisions

Section 245.310 Permit Denial

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Abby Dompke Chicago, IL 60607

Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Alen Makhmudov Chicago, IL 60637

In reference to Subpart C: Permit Decisions

Section 245.310 Permit Denial

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." Section 245.310 Permit Denial

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Anne Pertner Pertner Chicago, IL 60605

The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Camil Machaj Lemont, IL 60439

In reference to Subpart C: Permit Decisions

Section 245.310 Permit Denial

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Elizabeth Scrafford chicago, IL 60626

The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Gianna Chacon Chicago, IL 60605

In reference to Subpart C: Permit Decisions

Section 245.310 Permit Denial

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, joann conrad 13 red oak lane springfield, IL 62712

The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Kayli Horne Chicago, IL 60615

In reference to Subpart C: Permit Decisions

Section 245.310 Permit Denial

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, M J Smerken Murphysboro, IL 62966

The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Nancy Onderdonk 1456 W Granville Chicago, IL 60660

In reference to Subpart C: Permit Decisions

Section 245.310 Permit Denial

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Patrick Dexter Chicago, IL 60615

The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Rebecca McBride Mahomet, IL 61875

In reference to Subpart C: Permit Decisions

Section 245.310 Permit Denial

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Scott Condren Chicago, IL 60608

The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Sincerely, Vincent Beltrano Chicago, IL 60615

In reference to Subpart C: Permit Decisions

Section 245.310 Permit Denial

Comment: DNR's rules should include a provision that would authorize the recovery of attorney fees for those who successfully challenge a permit application. The Statutes: Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees where a person successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Also, section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." The Rules: But DNR's proposed rules do not allow for an award of attorney fees for an interested person who hires an attorney and successfully challenges a permit application. Given the typical situation--a vast disparity in financial resources between the typical industry applicant, on the one hand, and an adversely affected individual landowner or other interested person on the other, the ability to hire and pay for an attorney will be essential to ensuring a fair hearing on a contested permit application. Needed Revision: Section 245.310 should be revised to include a provision for the reimbursement of attorney fees to a person who successfully challenges a permit application.

Illinois law also limits compensation of experts needed in litigation to twenty bucks per diem for any deposition or testimony provided. Given the complexities of fracking, any plaintiff would be bankrupted paying qualified scientists to testify in litigation. I propose adding a clause to Section 245.345 that includes reimbursement of costs including and not limited to expert witness testimony fees, deposition fees and any other associated fees like copying expenses. The individual homeowners enter the legal arena against a very well funded corporation and the deck is stacked against the homeowner.

Sincerely, Paula Cade 213 Janet Lane Murphysboro, IL 62966

In reference to Subpart C: Permit Decisions

Section 245.310 Permit Denial

We all know the reality. An industry that makes $18 billion in profits has access to many more resources than the average individual who lives in central or southern Illinois. However, as the PennEnvironment report states, the public costs of hydraulic fracturing can be high, especially if not properly regulated. The oil and gas industry must not only pay for the damage that is done, but, if legal action is required to force them to comply with regulations or to recoup costs for environmental, health, or other kinds of costs, the plaintiffs--public, private, or otherwise--should not be saddled with the costs. http://www.pennenvironment.org/sites/environment/files/reports/The%20Costs%20of%20Fracking%20vPA_0.pdf The General Assembly, in its wisdom, understood that those who file and win litigation for harm caused via hydraulic fracturing should not be saddled with attorney's fees. Section 1-102(c) of the Hydraulic Fracturing Regulatory Act (225 ILCS 752/1-102(c)) allows a circuit court to award attorney fees to an individual who successfully sues to enforce compliance with the Act: "(c) The court, in issuing any final order in any action brought under this Section, may award costs of litigation (including attorney and expert witness fees) to any party, on the basis of the importance of the proceeding and the participation of the parties to the efficient and effective enforcement of this Act." Section 10-55(c) of the Illinois Administrative Procedure Act (5 ILCS 100/10-55(c)) allows a circuit court to award attorney fees to a party who successfully challenges a DNR rule in court: "(c) In any case in which a party has any administrative rule invalidated by a court for any reason, including but not limited to the agency's exceeding its statutory authority or the agency's failure to follow statutory procedures in the adoption of the rule, the court shall award the party bringing the action the reasonable expenses of the litigation, including reasonable attorney's fees." However, IDNR's proposed rules do not permit the award of attorney fees to an individual or other entity that successfully challenges a permit application in court. This is a clear discrepancy between the Act and the Rules, which needs to be rectified. IDNR should revise Section 245.310 to include a provision for the reimbursement of attorney fees to an individual/organization that has successfully challenged a permit application in court.

Sincerely, Sara Buck Chicago , IL 60640

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Dear IDNR, Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source."But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. At a minimum these revisions are necessary, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met." Kurt

Sincerely, Kurt Brian Witteman 425 S Wabash Ave WBRH 41 Chicago, IL 60605

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

It is absurd to think that all potential impacts of a proposed modification to a permit would be the "subject" of a modification to a permit. For instance an aftershock is not the subject of an earthquake, but it is most certainly related to it and can be equally devastating. Because of the potential public and occupational risks of a fracking operation, permit applicants should be required to mention all potential impacts of modifications in the relevant sections of the application even if it is not the subject. This section should state that sections "that are not impacted by" the proposed modifications need not be completed.

Sincerely, Sara Buck Chicago, IL 60640

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

It is clear from the Hydraulic Fracturing Regulatory Act that IDNR is charged with protecting the health and safety of Illinois citizens and their environment. As noted in numerous other comments, the Act states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source" [Section 1-53(a)(4)]. While subsection 245.300(c)(4) of the rules diminishes the strength of the Act's statement, it is still clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." While I am not at all happy with the ambiguous language of subsection 245.300(c)(4), I'd like to address the implication in Subsection 245.330(d) that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without any additional modification whatsoever to eliminate the potential risk. It seems entirely incongruent with IDNR's responsibilities to Illinois citizens and their environment that any permit modification posing serious risk to Illinois constituents and their environment would be accepted without modification. In order to rectify this situation, the following language should be added to this subsection, at the bare minimum: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Sara Buck Chicago , IL 60640

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) Effective Normal Stress and Induced Seismology If the effective normal stress, the frictional forces that hold a fault a place, is lowered, it can result in fault slippage and trigger earthquake nucleation. Increased fluid pressure relieves enough of squeeze on the fault to release it and induce an earthquake (Kerr, 2012). Injecting fluids that act as a pressurized cushion to relieve the effective normal stress that keeps a fault locked over-pressures a fault (Sheppard et al, 2013). Heather Savage, a geophysicist at Columbia University's Lamont-Doherty Earth Observatory, relates that, "When you over-pressure the fault, you reduce the stress that's pinning the fault into place and that's when earthquakes happen" (Earth Institute, 2013). Effective normal stress is equal to the difference between the applied normal stress and pore pressure (Ellsworth, 2013). Applied normal stress is the total stress on a rock (Hsieh, 1979), or the weight of a given block (Evans, 1966), and pore pressure is the pressure of fluid in the rock's pores and fractures (Ellsworth, 2013), such that increased pore pressure causes a decrease in frictional force, the effective normal stress (Warpinski, 2012).

Part 240: Seismicity (240.796) Fluid Pressure: Inducing Seismology By Exceeding Critical Value The discovery by David Evans published in his 1966 Geotimes study, which led to speculations that earthquakes might be controllable, was that the subterranean highpressure injection of fluid was responsible for the triggering of earthquakes at the Rocky Mountain Arsenal near Denver, Colorado in the early to mid 1960s. While earthquakes were being induced by the injection of pressurized wastewater into stressed rock formations, the reduction in fluid pressure caused a sharp decrease in frequency of seismic activity (Raleigh et al., 1976). A 1972 Tectonophysics study by Healy and others entitled “Prospects for earthquake prediction and control” more explicitly expressed this understanding and laid further groundwork for experimentally testing this hypothesis that, “Changes in fluid pressure may control timing of seismic activity and make it possible to control natural earthquakes by controlling variations in fluid pressure in fault zones” (Healy, et al., 1972). Raleigh, Healy and Bredehoeft’s landmark 1976 Science study “An Experiment in Earthquake Control at Rangely, Colorado” did demonstrate the capacity to turn on and turn off earthquakes and “established the correlation between fluid pressure and earthquakes beyond reasonable doubt,” that they concluded the “control of the San Andreas fault could ultimately prove to be feasible.” However, despite these earth-shattering revelations, perhaps the most important takeaway from these experiments was that, “successful prediction of the approximate pore pressure required for triggering of earthquakes according to the Hubbert-Rubey theory was possible” (Raleigh et al., 1976), as demonstrated by experimental verification of theoretical projections.

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) Fracking Wastewater in Deep-Injection Disposal Wells As there has been a monumental increase in total fracking-related wastewater produced over the last decade, there has likewise been a dramatic increase in total fracking wastewater injected into disposal wells, where 95% of the toxic effluent is managed. Of the more than 680,000 total injection wells in the United States, in excess of 150,000 fall into the energy industry-specific Class II category that includes both deep-disposal wells in addition to “wells in which fluids are injected to force out trapped oil and gas” (Lustgarten, 2012a). Approximately 30,000 to 40,000 of these Class II wells are deepdisposal wells that receive the volumes of fracking flowback and produced wastewater (Diep, 2013; Ellsworth, 2013; Soraghan, 2013). The states with the most Class II injection wells are Texas (52,016), California (29,505), Kansas (16,658), Oklahoma (10,629), and Illinois (7,843) (US EPA, 2010). A study by the Argonne National Laboratory estimated that a total of 252 billion gallons of fracking wastewater is injected into Class II deep disposal wells in the United States per year (Clark and Veil, 2009; Clarke et al., 2012). In Texas the total amount of fracking wastewater being injected into deep disposal wells went from 46 million barrels (1.45 billion gallons) in 2005 to nearly 3.5 billion barrels (110.25 billion gallons) in 2011, representing a 76-fold increase in total fracking wastewater injection volume in a six-year period (Galbraith and Henry, 2013). The total amount injected into the more than 150,000 total Class II wells among 33 states is at least 10 trillion gallons of wastewater (Lustgarten, 2012c), while over the last several decades all U.S. industries combined have injected in excess of 30 trillion gallons of toxic liquid into all classes of injection wells, “using broad expanses of the nation's geology as an invisible dumping ground” (Lustgarten, 2012a).

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) Historic Shift in Frequency of Midcontinent Earthquakes Seismologists like the U.S. Geological Survey's William Ellsworth started noticing a historically unique trend about a dozen years ago, "that there were an unusual number of earthquakes in the middle of the country," in areas that have not been known for earthquakes (Rugh, 2013). The Guy-Greenbrier area of Arkansas, with total population of just over 5,000, was traditionally a quake-free area. Throughout all of 2007 the area had only one earthquake of magnitude 2.5 or greater, followed by only two such quakes in 2008. However, in 2009 there were 10, and in 2010 there were 54 earthquakes of magnitude 2.5 or greater (Kerr, 2012). On February 27, 2011, Guy experienced a magnitude 4.7 earthquake. Neighboring state Oklahoma went through a similar pattern as a whole, experiencing just a few earthquakes per year from 1972 to 2007, 12 in 2008, 50 in 2009, and more than 1,000 in 2010, culminating with a magnitude 5.7 earthquake on November 6, 2011. While Oklahoma saw a more than hundred-fold increase in overall earthquakes, it also saw a twenty-fold increase in earthquakes with magnitude 3.0 or greater in those same three years from 2008 to 2010 (Ellsworth et al, 2012). Meanwhile, the Barnett Shale region of north central Texas has experienced "unprecedented levels of seismicity" since shale gas de¬velopment began in late 1998, with "nine earthquakes of magnitude 3.0 or larger occurred, compared with none in the preceding 25 years." Overall, the states reporting unusually elevated levels of seismic activity include Arkansas, Colorado, New Mexico, Ohio, Oklahoma Texas, and Virginia (Ellsworth, 2013). This pattern seen in both localized and statewide contexts is also reflected in data concerning the frequency of magnitude 3.0 or greater earthquakes in the entire U.S. midcontinent region, with the annual number of magnitude 3.0 or greater earthquakes having "in¬creased almost tenfold in the past decade" (Lovett, 2013). The "middle part of the continent" went from a remarkably consistent av¬erage 21 per year from 1970 to 2000, to an average of 29 per year from 2001 to 2008, to 50 magnitude 3.0 or greater quakes in 2009, to 87 in 2010, to somewhere in the range of 134 to 188 in 2011 (Demus, 2012; Ellsworth, 2013; Henry, 2012; Lovett, 2013). As William Ellsworth et al (2012) reported in their Seismological Research Letters study, "A naturally-occurring rate change of this magnitude is unprecedented outside of volcanic settings or in the absence of a main shock, of which there were neither in this region" (Ellsworth et al, 2012). Especially in areas that have historically lacked earthquakes, like the Youngstown, Ohio area, as Columbia University's Lamont-Doherty Earth Observatory seismologist John Armbruster relates, "Having that many earthquakes […] where there aren't a lot of earthquakes, was suspicious" (Fountain, 2012). What all these different scenarios share is a common time frame for the onset of fracking industrialization, and an ever-expanding need for deep-injection disposal wells [DIDWs] to handle the massive volumes of associated fracking flowback and produced wastewater. A 2013 Science study (van der Elst et al, 2013) by a team of seismologists led by Nicholas van der Elst of Columbia Uni¬versity's Lamont-Doherty Earth Observatory found, "that at least half of the magnitude-4.5 or larger earthquakes that have struck the inte¬rior United States in the past decade have occurred near injec¬tion-well sites" (Lovett, 2013). A 2013 Geology study (Keranen et al., 2013) by a team of seismologists led by Katie

Keranen concluded while earthquakes with magnitude 5.0 or greater are a rarity east of the Rocky Mountains, “the number per year recorded in the midcon¬tinent increased 11-fold between 2008 and 2011, compared to 1976–2007” (Keranen, 2013). When interviewed concerning col¬league response to the study, Keranen indicated that, “Pretty much everybody who looks at our data accepts that these events were likely caused by injection” (Behar, 2013).

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) Migrating Fluid and Precambrian Crystalline Basements An essential practical conclusion from the Groundwater study (Zhang et al, 2013) is the factor that has the single largest impact in preventing seismic induction within the underlying crystalline basement is the presence of a confining unit barrier between the sedimentary reservoir and the lower Precambrian layer. William Ellsworth describes those injection wells that "dispose of very large volumes of water and/or communicate pressure perturbations directly into basement faults" (Ellsworth, 2013) as problematic disposal wells. Geophysicist Barry Raleigh, whose 1976 Science study "An experiment in earthquake control at Rangely, Colorado" demonstrated how earthquakes could be turned on and off by utilizing manipulation of fluid pressure, elucidates that the deep, low-permeability, brittle igneous and metamorphic rock of the crystalline basement "doesn't have a lot of capacity for taking any of these fluids. As a storage medium, they're pretty crappy" (Kerr, 2012). Readily felt earthquakes larger than magnitude 4.0 that have been induced by injection of fracking wastewater into deep disposal wells additionally point to a deeper subterranean origin to these larger earthquakes. "Burdened by far more overlying rock, the deep rock is already carrying stress that," when combined with "the added pressure of the injection trigger," manifests conditions ripe for fault rupture and potentially destructive seismic activity (Kerr, 2012). Zhang et al. (2013) hypothesize that "elevated pore pressures could propagate downward along distributed fracture networks or along conductive fault zones in Precambrian crystalline rocks" (Zhang et al, 2013), meaning that the pressure from fluids can be potentially transmitted to hidden fractures at great depths, given the right conditions. In fact, David M. Evans, in his seminal 1966 Geotimes study, relates that even "if the Precambrian fracture system extends to a depth of 12 miles, then fluid pressure could [still] be transmitted to that depth by moderate surface injection pressure as long as the fracture system is open for transmission of that pressure" (Evans, 1966).

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) Pore Pressure and Induced Seismology Finally, elevating the pore pressure of the fluid in the rock can readily lead to seismic events given the proper conditions, like a stressed fault in contact with pressurized, migrating liquid. As the measure of the pressure of the fluid in the rock's pores and fractures, pore pressure is equal to the difference between applied normal stress and effective normal stress (Ellsworth, 2013). Thus as pore pressure increases, the effective normal stress will decrease. This effective normal stress can also be understood as the frictional resistance against the shearing stress along the fracture plane (Hsieh, 1979). If there is a sufficient enough increase in fluid pressure such that the shearing stress overcomes frictional resistance, the fault will slip and result in an earthquake. This is known as the Hubbert-Rubey mechanism, named after the findings in their seminal 1959 Geological Society of America Bulletin study "Role of fluid pressure in mechanics of overthrust faulting," as elucidated by Paul Hsieh: "The original work of Hubbert and Rubey (1959) actually concerns the role of pore pressure in the mechanics of overthrust faulting. They introduced the concept of rock movements caused by a Mohr-Coulomb-type failure in a fluid-filled rock environment. This concept was first cited by Evans (1966) in his paper on injection–earthquake relationship and subsequently gained wide acceptance as the mechanism through which injection has caused the earthquakes." (Hsieh, 1979) In his "A review of theories of mechanisms of induced seismicity" that was published in Engineering Geology, Kisslinger relates that fluid injection induced earthquakes "are adequately explained" by a combination of the concept of effective pressure in a waterfilled porous mechanism and the Coulomb-Mohr failure criterion, which embodies the three factors and their interrelationship that determines whether or not a particular fracking wastewater injection well will induce earthquakes (Kisslinger, 1976). Kisslinger further concludes that reservoir-related earthquakes, like those caused by fluid injection in bore holes, are induced by the same mechanisms, but in light of the lower injection pressures, "additional physical or chemical effects of the water on the materials may play an important role, [such as] a weakening of the materials in old fault zones by the introduction of water or static fatigue in silicate rocks due to stress corrosion (Kisslinger, 1976).

Part 240: Seismicity (240.796) Predicting Earthquake Behavior, Controlling Earthquakes By Manipulating Fluid Pressure Utilizing the Mohr-Coulomb failure criterion in applying the Hubbert-Rubey theory, Raleigh and colleagues projected that 257 bars (25.7 MPa) would be the Rangely site's critical fluid pressure. The critical fluid pressure, the pressure required to trigger an earthquake, is governed by the equation: †crit = μ(Sn – Pc), with †crit = shear stress at failure point, μ = coefficient of static friction of the rocks, Sn = effective normal stress, and Pc = critical fluid pressure that induces seismicity. "The fluid pressure required to trigger earthquakes on preexisting fractures" was experimentally tested against the theoretical projections through use of "laboratory measurements of the fric-tional properties of the reservoir rocks and an in situ stress meas-urement made near the earthquake zone" (Raleigh et al., 1976). Experimental results, which were obtained by varying fluid pressure through the process of "alternately injecting and recovering water from wells that penetrated the seismic zone" (Raleigh et al., 1976), demonstrated that when the injection wells were subjected to fluid pressures above 257 bars the earthquake frequency increased, and when the fluid pressure was less than 257 bars the earthquakes subsided. The idea is that for any given injection well and pre-existing fault situation a critical fluid pressure can be determined, such that "we may ultimately be able to control the timing and the size of major earthquakes […] wherever we can control the fluid pressure in a fault zone" in relation to that critical fluid pressure (Raleigh et al., 1976). Hsieh and Bredehoeft (1981), in an expansion of Hsieh's 1979 master's thesis (Hsieh, 1979), analyzed the Rocky Mountain Arsenal injection wells and earthquakes in similar fashion, utilizing Hubbert-Rubey theory to identify the fluid pressure critical value, "the pressure build-up above which earthquakes occur" (Hsieh, 1979). Their conclusion was that, "At the Rocky Mountain Arsenal near Denver, earthquakes occurred within the crystalline basement when the fluid pressures were raised over 320 m above hydrostatic conditions [32 bars, 3.2 MPa] between a depth of about 0.7–7 km (Hsieh and Bredehoeft, 1981; Zhang et al, 2013). Another way to frame this is that the earthquakes were confined strictly to those parts of the reservoir where the pressure build-up exceeded 32 bars (Hsieh, 1979). According to Davis and Frohlich (1993), Hsieh and Bredehoeft's breakthrough was that they were "able to explain the spatial and temporal extent of seismic activity in Denver in terms of the flow of fluids along a permeable semi-infinite rectangular region which approximately contained the activity."

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) Proliferation of Shale Gas & Oil Extraction and Fracking Wells Over the last decade the United States has seen an unprecedented increase in the proliferation of shale gas and oil extraction that has pushed domestic oil to its current place of highest level of production in 20 years, while bringing natural gas production to an all-time high (Weber, 2013). Shale gas from fracking specifically has gone from only 2% of U.S. natural gas production in 2000 to 23% of NG production in 2010 (US EIA, 2012). Because of fracking, the International Energy Agency projects that the U.S. will overtake Russia as the world's top producer of natural gas by 2015. With this precipitous increase in shale oil and gas production, the U.S. has likewise seen an increase in the proliferation of fracking wells, with more than 82,000 drilled or permitted in 17 states between 2005 and 2012. At the time of this writing (November of 2013) there are likely in excess of 100,000 fracking wells permitted or drilled in the U.S. (Ellsworth, 2013). In 2012 alone there were 22,326 fracking wells drilled throughout the United States, with more than 60% of them (13,540) being drilled in Texas (Ridlington & Rumpler, 2013). During that year drilling inspectors identified more than 55,000 violations of Texas fracking laws by oil and gas companies (Soraghan, 2013a).

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) Rate of Fluid Injection and the Work of Cliff Frohlich A third surface-controlled parameter that can impact fracking wastewater disposal induced seismicity is that of rate of fluid injection. While the rate of fluid injection and withdrawal played role in the Rangely, Colorado earthquake control experiments (Healy, et al., 1972), few scientists outside of Cliff Frohlich are investigating what he has observed to be a relationship between high rates of fluid injection and induced seismicity. From varies studies of the Barnett Shale play in Texas, Frohlich has found that injection wells nearest induced earthquake groups consistently reported maximum monthly injection rates in excess of 6.34 million gallons (24,000 cubic meters) of fluid, “and generally these injection rates had been maintained for a year or more prior to the onset of earthquake activity” (Frohlich, 2012). While Frohlich has indicated in interviews that he is very much interested in pursuing this line of inquiry in other fracking wastewater injection regions (Choi, 2012), his own studies have already indicated that other faulted areas demonstrate different maximum monthly injection rates required to induce earthquakes, such as a fluid injection rate of 9.5 to 12.7 million gallons (32,000 to 48,000 cubic meters) per month in the case of Paradox Valley, Colorado (Frohlich et al, 2010). While there is still a lot of research and experimentation required to clarify the precise role of the three surface parameters of fluid pressure, total fluid volume, and rate of fluid injection in triggering earthquakes, William Ellsworth concurs that experimental results distinctly suggest that these factors all “may be a predictor of seismic potential” (Ellsworth, 2013).

Part 240: Seismicity (240.796) Shutting Down of Wells that Induced Earthquakes Geologists and seismologists are not the only engaged professionals raising concerns about fracking wastewater disposal related induced seismology. State oil and gas officials in both Arkansas and Ohio have shut down fracking wastewater disposal wells that have been connected with induced earthquakes. In the case of induced seismology in the Guy- Greenbrier area or Arkansas, the state's governor, Oil and Gas commission, and the general public all concurred to shut down the responsible injection-wells as, "nearly 1000 recorded quakes had struck the area since the wells had started up" (Kerr, 2012). A moratorium was declared within a 1,150 square mile area around Guy-Greenbrier on deepinjection wastewater disposal activities, while seismic-risk studies of the entire Fayetteville shale play were also required. Additionally, "Affected residents filed a class-action lawsuit against Chesapeake Energy and BHP Billiton Petroleum—the first time anyone has sued oil and gas companies for causing an earthquake" (Behar, 2013). University of Memphis seismologist Stephen Horton related that once the wells were shut down the quakes tapered away and ultimately ceased (Kerr, 2012).

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) The Long Understood Relationship Between Subterranean Fluid Disposal & Induced Seismology Some may point to 77 CE Rome for the origins of the human demonstration of the relationship between elevated fluid pressure and induced geological failure, a welldocumented case in which Romans utilized the technique to "undermine and instantly remove vast quantities of mountainside to extract gold from the buried mother lode at Las Médulas in northwest Spain" (Goodway, 2012). Others might claim that we have shared this understanding for almost a century, such as members of the Committee on Induced Seismicity Potential in Energy Technologies, who claim that "induced seismic activity has been documented since at least the 1920s" (Clarke et al., 2012), referencing a 1926 study that ran in the Bulletin of the Seismological Society of America regarding "Local subsidence of the Goose Creek oil field (Texas)" (Pratt and Johnson, 1926). While these obscure examples add clarity to this generally familiar yet elusive phenomenon, it is David M. Evans' 1966 Geotimes study "Man-made earthquakes in Denver" that is popularly credited with establishing the connection between injection of waste fluids and induced earthquakes (Choi, 2012; Ellsworth, 2013; Frohlich, 2012; Henry, 2012; Kerr, 2012; Soraghan, 2013), such that "since 1966, scientists have generally agreed that injection may induce earthquakes in tectonically favorable situations" (Davis and Frohlich, 1993). Keep in mind that Plate Tectonic Theory did not come into general acceptance until just one-year prior, in 1965, to the verification of this form of human induced earthquake phenomena.

Others might claim that we have shared this understanding for almost a century, such as members of the Committee on Induced Seismicity Potential in Energy Technologies, who claim that "induced seismic activity has been documented since at least the 1920s" (Clarke et al., 2012), referencing a 1926 study that ran in the Bulletin of the Seismological Society of America regarding "Local subsidence of the Goose Creek oil field (Texas)" (Pratt and Johnson, 1926). While these obscure examples add clarity to this generally familiar yet elusive phenomenon, it is David M. Evans' 1966 Geotimes study "Man-made earthquakes in Denver" that is popularly credited with establishing the connection between injection of waste fluids and induced earthquakes (Choi, 2012; Ellsworth, 2013; Frohlich, 2012; Henry, 2012; Kerr, 2012; Soraghan, 2013), such that "since 1966, scientists have generally agreed that injection may induce earthquakes in tectonically favorable situations" (Davis and Frohlich, 1993). Keep in mind that Plate Tectonic Theory did not come into general acceptance until just one-year prior, in 1965, to the verification of this form of human induced earthquake phenomena.

Part 240: Seismicity (240.796) The Long Understood Relationship Between Subterranean Fluid Disposal & Induced Seismology Some may point to 77 CE Rome for the origins of the human demonstration of the relationship between elevated fluid pressure and induced geological failure, a welldocumented case in which Romans utilized the technique to "undermine and instantly remove vast quantities of mountainside to extract gold from the buried mother lode at Las Médulas in northwest Spain" (Goodway, 2012). Others might claim that we have shared this understanding for almost a century, such as members of the Committee on Induced Seismicity Potential in Energy Technologies, who claim that "induced seismic activity has been documented since at least the 1920s" (Clarke et al., 2012), referencing a 1926 study that ran in the Bulletin of the Seismological Society of America regarding "Local subsidence of the Goose Creek oil field (Texas)" (Pratt and Johnson, 1926). Part 240: Seismicity (240.796) The Mechanisms Underlying Earthquakes Induced by Fracking Wastewater DIDWs In regards to the fracking wastewater disposal-induced earthquakes that have been escalating in frequency in the United States' midcontinent over the last decade, U.S. Geological Survey's William Ellsworth concludes that the mechanism responsible for inducing this seismic activity is the "well-understood process of weakening a preexisting fault by elevating the fluid pressure" (Ellsworth, 2013). Ellsworth clarifies that the three specific events that can trigger the nucleation of an earthquake by bringing the fault to failure are, 1) reducing the effective normal stress on a locked fault, 2) increasing the shear stress along a fracture plane, and 3) elevating the pore pressure of the fluid in the rock. Nucleation is the process that marks the beginning of an earthquake with an initial rupture that propagates along the fault surface. Fault failure or slippage can trigger this process, and in turn, generate an earthquake (Ellsworth, 2013).

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) The Youngstown, Ohio Fracking Wastewater Disposal Induced Earthquakes When a magnitude 2.7 earthquake struck near Youngstown, Ohio on December 24, 2011, it was the tenth such earthquake in the 2.0 to 2.7 magnitude range since March of that year connected with fracking wastewater injection well Northstar 1 owned by D&L Energy Group. The well, which came online in December 2010 (just three months prior to start of seismic activity), received the vast majority of its wastewater from fracking projects in Pennsylvania (Fountain, 2012). Nearly 60% of all the fracking wastewater disposed of in Ohio injection-wells in 2012, 257 million gallons, originated in others states, marking a 19% one-year increase in out-of-state fracking wastewater injected into subterranean Ohio (Johanek, 2013). Prior to January 2011 Youngstown, Ohio had not experienced an earthquake dating back to 1776 when scientists first began recording their observations (Choi, 2013). Upon analysis of the December 24, 2011 earthquake by the Ohio Department of Natural Resources it was determined that the quake originated less than 2,000 feet below the Northstar 1 well (Fountain, 2012). No sooner had the State of Ohio put an immediate cessation to injection at the well, when an earthquake with a 16 times greater magnitude of 3.9 struck the following week, on New Year's Eve, December 31, 2011. At that point state officials instituted a moratorium on the injection of fracking wastewater within a 5-mile radius of the D&L well until scientists had an opportunity to analyze the data from the string of quakes (Fountain, 2012). By the time March 2012 rolled around, Youngstown, Ohio had recorded 109 earthquakes in the previous year (Choi, 2013), and "the indications were strong enough to prompt the state to order the shutdown of four injection wells in the area and issue strong new regulations" (Kerr, 2012). On July 12, 2012 Executive Order (2012-09K) was signed by Ohio Governor John Kasich, which required that operators conduct seismic studies prior to issuance of well permits (Kasich, 2012). Ohio now stands alone in requiring a seismic-risk assessment for all of its injection wells, as every other state, and the federal government, have yet to do (Behar, 2013). Seismologist John Armbruster puts points out that within a year of the Northstar 1 well opening there were 109 total earthquakes, and "twelve felt earthquakes. After the well was shut down, the number decreased dramatically. You'd need Powerball odds for that to be a coincidence" (Behar, 2013).

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) Total Injected Fluid Volume and Maximum Earthquake Magnitude The relationship between total fluid volume injected and induced seismology has been noted by many, whether it is the “qualitative correlation between earthquake rates and the injected volume” that has served as a tool for investigating the triggered earthquake phenomena (Oprsal and Eisner, 2013), or the case history-driven evidence suggesting a connection between the total volume of injected wastewater and the maximum induced earthquake magnitude (Hayes, 2012). The U.S. Geological Survey’s Art McGarr has compiled the data from these case histories and reports from fracking, waste disposal and geothermal induced seismic events, and has graphed Total Injected Volume vs. Maximum Earthquake Magnitude for 17 different cases of demonstrated fluid disposal triggered earthquakes (Holland and Keller, 2012; Verdon, 2013a; Verdon, 2013b): Total Gal. Magnitude Injected Richter (thousands) Scale Location . 53 1.4 Bavaria Germany (KTB) 1,057 2.3 Blackpool, England (BUK) 2,325 2.8 Garvin County, Oklahoma (GAR) 3,170 3.4 Basel, Switzerland (BAS) 9,774 3.7 geothermal at CBN 10,567 2.9 Soultz, France (STZ) 15,850 3.6 Ashtabula, OH (ASH) 21,134 3.9 Youngstown, Ohio (YOH) 89,818 3.8 Ashtabula, OH (ASH) 103,026 4.4 Raton Basin, Colorado (RAT) 158,502 4.6 Guy, Arkansas (GAK) 158,502 4.7 Rocky Mountain Arsenal (RMA) 766,093 5.0 Raton Basin, Colorado (RAT) 845,344 4.3 Paradox Basin, Colorado (PBN) 1,320,850 5.3 Raton Basin, Colorado (RAT) 3,170,040 5.7 Prague, Oklahoma (POK) While “McGarr found a relationship between the maximum magnitude of induced earthquakes and the total volume of fluid injected into a site” (Balcerak, 2013), James Verdon reminds us that the McGarr model “is only empirical, there is no real physics behind it” (Verdon, 2013a). McGarr’s model does, however, create an interesting framework for further theoretical and experimental work, while also leading to the derivation of the McGarr equation for injection-induced seismicity: M0(max) = G?v, with M0(max) = magnitude of largest seismic moment, G = shear modulus of rock (ratio of shear stress to shear strain), and ?v = total volume of fluid injected. Despite potential shortcomings, Verdon does admit that, “In the meantime, we are left with the empirical McGarr equation as our main guide” (Verdon, 2013a). He also makes certain to clarify: “It should of course be remembered that the McGarr equation does not tell you the maximum magnitude you will get in an operation. […] The McGarr line tells you the maximum magnitude you could get if you are very unlucky” (Verdon, 2013a). While McGarr continues to clarify the undeniable connection between the total injected fluid volume and the potential maximum magnitude of induced earthquakes, he does not find the rate of fluid injection to impact the magnitude of triggered earthquakes, but rather he found “that the rate of injection of fluid influences the frequency of induced earthquakes” (Balcerak, 2013).

Section 245.330 Permit Modifications

Part 240: Seismicity (240.796) Various Methods for Disposing of Fracking Wastewater While there are current alternatives to deep-well injection for disposing of fracking wastewater, scientists and regulators alike agree that the other options are generally far more expensive while embodying additional environmental risks (Lustgarten, 2013a). These alternatives, the first three of which have been utilized extensively in the Marcellus region due to lack of suitable geology for underground injection (MSAC, 2011), include: (1) Processing of wastewater at municipal wastewater treatment facility with final discharge into a local waterway; (2) Processing of wastewater at a private industrial wastewater facility, with either discharge into a local waterway or reuse of the treated effluent in fracking wells; (3) Recycling of wastewater and reuse of the partially treated effluent in fracking wells; (4) Burning of waste; (5) Disposal of waste by application on roadways and other surfaces (Lutz et al, 2013; Lustgarten, 2012a); and unfortunately, (6) “Fracking flowback is dumped into rivers, lakes and reservoirs” (Eco Watch, 2013). Cliff Frohlich, senior research scientist at University of Texas at Austin’s Institute for Geophysics, reminds us that “the people involved in this are going to do the cheapest way of doing things that is generally considered safe” (Henry, 2012a), and that is currently why more than 95% of fracking wastewater is injected into deep wells (Clark and Veil, 2009). Journalist Abrahm Lustgarten, however, reminds us that, “several key experts acknowledged that the idea that injection is safe rests on science that has not kept pace with reality, and on oversight that doesn't always work (Lustgarten, 2012a). It is not just the energy sector that is dependent on this form of waste elimination, as subterranean waste disposal is a cornerstone of the U.S. economy, with pharmaceutical, chemical and agricultural industries all being dependent upon deep-well injection for managing voluminous waste streams. Even carbon storage and sequestration that is the essential fossil fuel industry strategy for addressing climate change, as Lustgarten points out, “counts on pushing waste into rock formations below the earth's surface” (Lustgarten, 2012a).

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Alen Makhmudov Chicago, IL 60637

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Amelia Dmouska Chciago, IL 60637

But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Ava Benezra Chicago, IL 60615

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

In reference to Subpart C: Permit Decisions

Section 245.330 Permit Modifications

Section 1-53(a)(4) of the Statute states that hydraulic fracturing operations "will be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." This portion of the regulations was incorporated into subsection 245.300(c)(4) of the rules, which, although not as strict, makes clear that no permit may be issued unless the high volume horizontal hydraulic fracturing operations at issue "are reasonably expected to be conducted in a manner that will protect the public health and safety and prevent pollution or diminution of any water source." But Subsection 245.330(d) seems to imply that a permit modification that poses a "serious risk" to public health or the environment could nonetheless be granted without changes that eliminate that risk. While we disagree with the loosening of the language of 1-53 the regs to 245.300 of the rules, it would be difficult to imagine that a rule that expects fracking to be conducted in a manner that will "protect the public health and safety and prevent pollution of diminution of any water source" would allow fracking to occur when a "serious risk" exists. Revisions Needed: At a minimum, the following language should be added to this subsection: "Modification to a permit shall not be granted unless and until the proposed action is modified so that the criteria set forth in subsection 245.300(c)(4) are met."

Sincerely, Chris Turner Chicago, IL 60637
