

Xanthocephalus xanthocephalus (Bonaparte)

YELLOW-HEADED BLACKBIRD

ICTERIDAE

Status: Endangered in Illinois

Present Distribution: The yellow-headed blackbird breeds from western North America and southwestern Ontario south to Baja California, New Mexico, Texas, Missouri and Illinois. In Illinois most recent nesting has occurred in the northern portion of the state.

Former Illinois Distribution: In Illinois, the yellow-headed blackbird has probably always been restricted to the prairie regions in the northern part of the state, where it was once a locally abundant breeding bird (Nelson 1876b, Ridgway 1889).

Habitat: This colonial blackbird nests in emergent vegetation of deep-water palustrine wetlands (Heidorn et al. 1991, Twedt and Crawford 1995). Nests are built over relatively deep water, usually in cattails, bulrushes, or reeds (Twedt and Crawford 1995). This bird forages within wetlands and surrounding croplands, or savanna.

Reason for Status: In Illinois, the yellow-headed blackbird is at the eastern limit of its range. The Illinois population is small, declining, and isolated from the main North American breeding range for this species (Ward 2004).

Management Recommendations: Maintenance of open marsh habitat appears to be important for sustaining nesting colonies. However, although habitat loss undoubtedly contributed to historical population declines for this species, habitat availability may not be limiting current populations, and reproductive success in Illinois populations is also presently high (Ward 2004). Current declines in Illinois may be caused by low immigration from other portions of the breeding range (Ward 2004). As a result, greater connectivity with other portions of the range may be necessary to conserve this isolated population of yellow-headed blackbirds.

Xanthocephalus xanthocephalus
(Yellow-headed Blackbird)

MAMMALS (Mammalia)

Canis lupus Linnaeus

GRAY/TIMBER WOLF

CANIDAE

Status: Threatened in Illinois
Federally Endangered

Present Distribution: Throughout the 20th Century, wolves have not been documented in Illinois. Currently, more than 2,000 wolves live in the wild in Minnesota, with several hundred animals in Michigan, Wisconsin, and the Rocky Mountains of Montana, Idaho, and Wyoming. In Alaska, wolf populations number around 7,000 and are not considered endangered or threatened. In December, 2002 a wolf originating from the Great Lakes pack (either in Minnesota, Wisconsin, or Michigan) was shot and killed in Marshall County, Illinois. In July, 2003 a wolf originating from northern Wisconsin was found dead in an eastern Indiana soybean field (Randolph County, Indiana). This animal traveled through Illinois (greater metropolitan Chicago) before being recovered in Indiana.

Former Illinois Distribution: The gray wolf was once abundant and widespread throughout Illinois. Shortly after their arrival in Illinois, pioneers set about the task of "taming the wilderness". Destroying wolves was considered a moral duty necessary to make the wilderness fit for civilization. The last known record of self-sustaining wolf population(s) in Illinois is from Jackson County in 1889 (McClain et al. 2002).

Habitat: Substantial populations of the gray wolf still exist throughout most of Canada and Alaska. In the Midwest, pack numbers continue to grow throughout northern Minnesota, Wisconsin, and Michigan. Throughout its range, wolves occupy diverse habitats, including forests, prairies, tundra, and mountains. The two habitat factors for wolves appear to be an abundance of large game and minimal interference from humans (Kurta 1995).

Reason for Status: The final federal reclassification of the gray/timber wolf was published in the Federal Register on April 1, 2003. This reclassification established three (3) distinct population segments, whereby USFWS Region 3 (which includes Illinois) is entirely within the Eastern Gray Wolf Distinct Population Segment, where all wolves are threatened. Under Illinois' Endangered Species Protection Act states that all species classified as threatened or endangered by the USFWS are automatically placed on the State list.

Management Recommendations: Most biologists believe any wolves wandering into Illinois now, or in the future, will be young adults dispersing from packs, looking to establish their own territory. Chances for a self-sustaining, breeding wolf population in Illinois are highly unlikely given our abundance of roads and our highly fragmented, agriculturally dominant landscape. There is no record of an attack and death of a person caused by healthy wolves on the entire North American continent. The small number of cases involving injuries from wolves are those involving animals accustomed to being fed by humans.

Corynorhinus rafinesquii (Lesson)

RAFINESQUE'S
BIG-EARED BAT

VESPERTILIONIDAE

Status: Endangered in Illinois

Present Distribution: Rafinesque's big-eared bats are primarily known from southeastern United States. A small, but distinct population protrusion parallels the Wabash River Valley into southern Indiana and Illinois. Existing at the northern edge of its range in Illinois, this bat has only been recorded from Alexander, Jackson, Johnson, Pulaski, and Union counties. A single record of an anomalous migrant from Wabash County, near Mt. Carmel, Illinois exists (Elder 1945).

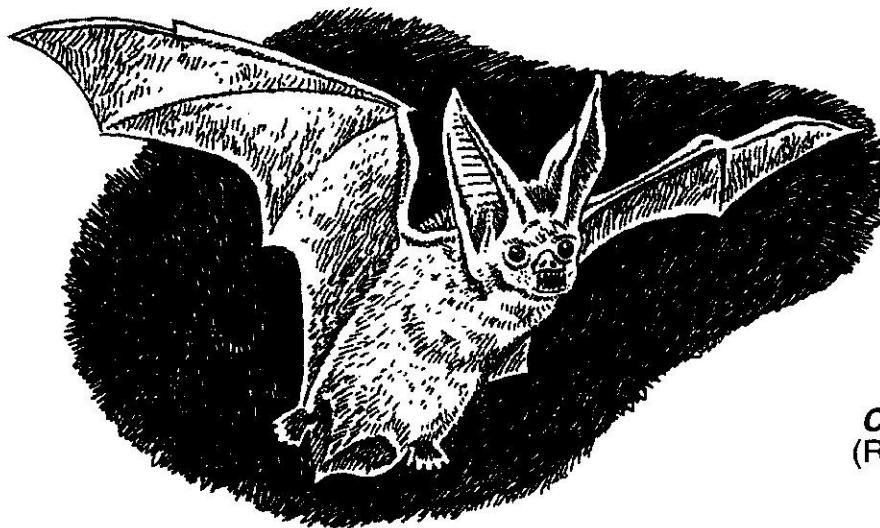

Former Illinois Distribution: In the early 1900s, this species was not known to occur in Illinois (Cory 1912). Of the sparse Illinois records, the largest numbers of big-eared bats are from a summer colony discovered in the downstairs room of an abandoned hunting cabin in Johnson County in 1977. This population peaked at 48 bats in 1983 and fell to zero by 1999. Similarly, a 1991 survey of an abandoned hunting cabin in Alexander County yielded 20 bats. No bats were present when the cabin was surveyed in 1999 (Kath 2000).

Habitat: Rafinesque's big-eared bats roost in unoccupied buildings and other man-made structures as well as trees and caves (Jones 1977). In winter this species has been encountered in Illinois silica sand mines and caves in Alexander, Jackson, Johnson, and Union counties (Hoffmeister 1989, Kath 2002). These bats are quite tolerant of temperature extremes as evidenced by the frequency at which hibernating individuals are found as singles often within 30 m of the cave/mine entrance (Mumford and Whitaker 1982). Unlike most Illinois' bat species, big-eared bats arouse from hibernation easily and even become active and fly outside their hibernaculum during the winter (Hoffmeister 1989).

Reason For Status: This species has been documented in the state from only four locations in the last 15 years. Most occurrences are from the Little Black Slough area in Johnson County.

Management Recommendations: More detailed information of the status and distribution of this species within Illinois is needed. Presently, the prime recovery objective for this species is to preserve and protect structures (both natural and man-made) used at any time of year by the big-eared bat. Such structures have a strong chance of being re-colonized, if properly restored and protected.

Note: This species was referred to as *Plecotus rafinesquii* in earlier editions of this work (Herkert 1992).

Corynorhinus rafinesquii
(Rafinesque's Big-eared Bat)

Myotis austroriparius (Rhoads)

SOUTHEASTERN MYOTIS

VESPERTILIONIDAE

Status: Endangered in Illinois

Present Distribution: The southeastern myotis occurs in the southeastern United States including parts of Florida, Georgia, Alabama, Louisiana, Mississippi, North and South Carolina, Tennessee, Kentucky, and Arkansas. A prominent northern population protrusion follows the Mississippi River into extreme southern Illinois and Indiana. There are recent records for this species from six Illinois counties (Alexander, Hardin, Johnson, Massac, Pope and Pulaski). Winter surveys from 1997 through 1999 have revealed small populations (15-25 bats) of hibernating southeastern myotis from one cave in Pope County and one cave in Hardin County (Kath 1999b).

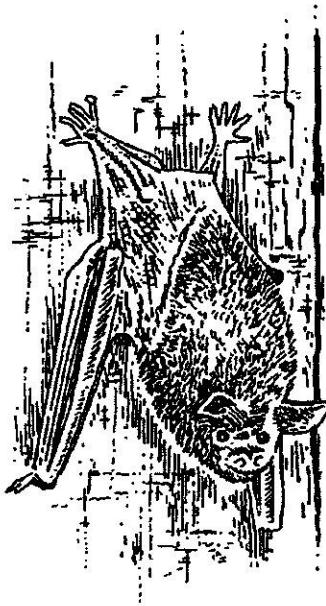

Former Illinois Distribution: Between 1950-1975 the southeastern myotis was reported from Alexander, Hardin, Johnson, and Union counties (Hoffmeister 1989). Extensive summer mist netting efforts at 55 sites scattered throughout the 11 southernmost Illinois counties were conducted from 1984 through 1991. A total of 68 southeastern myotis were captured at three of the 55 sites (one site each in Alexander, Pope and Pulaski counties)(Hofmann *et al.* 1999).

Habitat: Within Illinois, the southeastern myotis occupies caves, mines, and mature forested wetlands (Gardner *et al.* 1992). Summer roosts are usually near water over which they forage (Hoffmeister 1989), and winter hibernacula are generally in caves. The southeastern myotis is often found in caves supporting large populations of the more common eastern pipistrelle bat (*Pipistrellus subflavus*). These animals exhibit an affinity for roost sites in dry portions of caves (Barbour and Davis 1974). Gardner *et al.* (1992) discovered the first maternity colony north of Louisiana and Florida roosting in a hollow tree in Little Black Slough in Johnson County (Hofmann *et al.* 1999). In Illinois, Hofmann *et al.* (2002)

were the first to document southeastern myotis maternity colonies using a cave in Pope County, and an abandoned silica mine in Alexander County.

Reason For Status: The southeastern myotis has a very restricted distribution in Illinois. Its long nightly flights from its roost to forage (recorded to be greater than 6 km in southern Illinois), and its infrequent capture in mist nets during the summer makes this species very difficult to study. Range-wide, the single most serious case of decline in southeastern bat populations continues to be human destruction of roosts and the bats themselves.

Management Recommendations: Protection of wetland and cave habitat known to be used by this species is the greatest management need. Protection efforts must be concentrated during periods of residence. Specifically, disturbance at maternity caves/mines should be avoided from April 1 through August 31; disturbance at hibernacula should be avoided between September 1 and April 30.

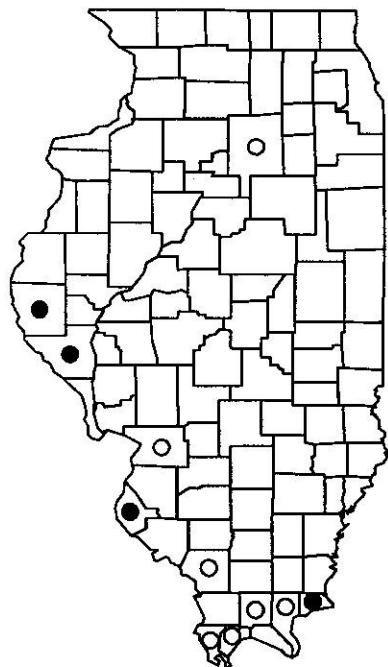

Myotis austroriparius
(Southeastern Myotis)

Myotis grisescens A.H. Howell

GRAY BAT

VESPERTILIONIDAE

Status: Endangered in Illinois
Federally Endangered

Present Distribution: The range of this species extends from eastern Kentucky and Tennessee to western Missouri and northeastern Oklahoma, extending in the east through Alabama to northwestern Florida. In Illinois, gray bats are known from 11 counties in the extreme southern and west-central parts of the state. Recent winter surveys by Illinois Department of Natural Resources staff (1997-2002) did not reveal any gray bats (Kath 1999a). Small summer populations have recently (2000, 2002) been discovered using two caves in Monroe County and one in Hardin County.

Former Illinois Distribution : Although probably never common or widely distributed in Illinois, the population has drastically decreased from 10,000 animals in the mid-1960s to 1,000 to 2,000 in 1975. A large majority of this population, and the subsequent decline, occurred at the Cave Spring Cave in Hardin County (Whitaker 1975).

Habitat: Of any North American mammal, gray bats are the most restricted to cave habitats. These animals roost, raise their young, and hibernate almost exclusively in caves (Hoffmeister 1989). Consistent winter temperatures ranging from 42 to 52 degrees F must be present in order for this species to survive. Given their strict torpor requirements, approximately 95% of the entire known population hibernates in 10-12 caves each winter, with over 50% utilizing a single cave in northern Alabama. Summer caves, especially those used by maternity colonies, must act as warm air traps or provide isolated caverns and/or domed ceilings capable of trapping the body heat from clustered individuals. Temperatures typically range from 57 to 77 degrees F in caves used by gray bats during the summer (Tuttle 1976a). Foraging is almost exclusively over rivers, streams, and lakes within 1 km of their caves (Tuttle 1976b, LaVal et al. 1977).

Reason For Status: The alarming decline in the number of gray bats is due to increased human disturbance and vandalism to colonies in both their winter and summer caves (Skaggs 1973, Barbour and Davis 1974, Tuttle 1979). In addition, exclusion from hibernacula by blockage of entrances (naturally occurring or human induced), improperly constructed bat gates that do not allow for bat flight and/or proper air flow, and pesticide poisoning of insect prey continue to be major documented causes of gray bat declines (Clark et al. 1978, 1983). This species is intolerant of human disturbance and even a moderate level of human activity can exclude gray bats from a suitable cavern.

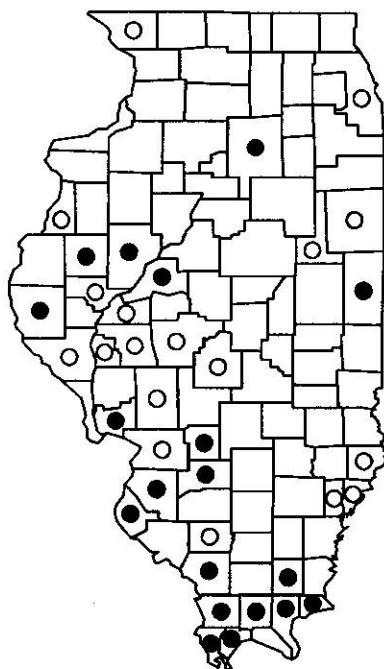

Management Recommendations: All Illinois colonies should be censused regularly to monitor population trends. Entry into maternity caves should be strictly prohibited. Entry into other caverns known to be used by gray bats should be restricted, especially from March through October. Since the majority of the population utilizes relatively few caves nationwide, protection of these sites has significantly aided gray bat recovery. Several caves outside of Illinois have had spectacular increases in gray bats due to proper gating and educational signs. In some cases, protecting caves that have been abandoned has resulted in re-occupation.

Myotis sodalis Miller & Allen

INDIANA BAT

VESPERTILIONIDAE

Status: Endangered in Illinois
Federally Endangered

forage and fly within an air space ranging from 2 to 30 m above ground level (Humphrey et al. 1977). Most Indiana bats caught in mist nets are captured over streams and other flyways at heights greater than 2 m (Gardner et al. 1989).

Reason For Status: Based on censuses taken at hibernacula over the entire range of this animal, the total known Indiana bat population was estimated at approximately 353,000 bats in 1995-1997. This represents a decline of about 60% since population surveys began in the 1960s (USFWS 1999). Although several known human related factors have caused past declines, they do not appear to account for the declines now being witnessed (USFWS 1999). Documented causes of decline include vandalism and commercialism of caves and natural catastrophes such as flooding and/or collapse.

Management Recommendations: Management of hibernacula should continue, including restricted entry (especially while bats are hibernating) and the elimination of activities destructive to caves. Caves/mines with hibernating Indiana bats should not be entered between September 1 and April 30. Riparian and upland forest tracts and active roost trees in areas used by Indiana bats should be conserved as much as possible (Kath 1999c).

Myotis sodalis
(Indiana Bat)

Neotoma floridana (Ord)

EASTERN WOODRAT

MURIDAE

Status: Endangered in Illinois

Present Distribution: Eastern woodrats occur across much of the southeastern and south-central United States (Hall 1981). The subspecies *Neotoma floridana illinoiensis* occurs in extreme southern Illinois, southeastern Missouri, western Kentucky, and Tennessee, eastern Arkansas, most of Mississippi and Alabama, and the panhandle of Florida (Schwartz and Odum 1957, Wiley 1980, Hall 1981). Sites occupied by woodrats in southern Illinois are isolated from the nearest known populations 75 miles to the west in Missouri and 85 miles to the south in Tennessee (Nawrot and Spitzkeit 1986). The largest and most persistent population in Illinois occurs at Pine Hills in Union County (Swayne 1949, Crim 1961, Nawrot 1974, West 1986, Wagle 1996, Monty 1997). Smaller populations occur at Fountain Bluff, Horseshoe Bluff, Little Grand Canyon, and Cripps Bend in Jackson County (Monty *et al.* 1995, Wagle 1996, Monty 1997).

Former Illinois Distribution: Skeletal remains establish a prehistoric (c.a. 8500-1500 BC) distribution which included portions of Randolph and Monroe counties (Parmalee 1959, Parmalee *et al.* 1961), 65 miles north of where woodrats now exist in Illinois. Nawrot and Klimstra (1976) found direct evidence of past habitation by woodrats at 24 sites in Jackson, Union, Johnson, Pope, Gallatin, and Hardin counties. Nawrot (1974) listed 40 sites in Jackson, Union, Williamson, Johnson, Saline, Pope, Gallatin, and Hardin counties that seemed to offer suitable habitat, but provided no direct evidence of past habitation.

Habitat: In Illinois, nearly all records of this species are from limestone bluffs of the Mississippi River and sandstone outcrops in the Shawnee Hills (Nawrot and Klimstra 1976). The eastern woodrat is primarily a nocturnal woodland species that builds large "houses" of twigs and sticks about 1 m in diameter and 1 m high. These shelters are usually found in rock crevices, on ledges, or in piles of rock at the bases of bluffs. During August through October, woodrats collect and store food items for consumption during winter (Crim 1961). Hickory nuts, acorns, and legumes from honey locust, black locust and Kentucky coffee trees are important foods (Wagle and Felhamer 1997).

Reason For Status: Illinois occurs at the extreme northern edge of this species' range. Nawrot and Klimstra (1976) speculated unusually harsh winters during 1912 and 1918 caused a large decline in numbers of woodrats at Pine Hills and extirpation of colonies in the Shawnee Hills.

Management Recommendations: The recovery plan for this species calls for translocations from nearby states to re-establish woodrat populations at unoccupied sites where colonies existed historically, link existing populations with newly established colonies in the Shawnee Hills, and improve genetic heterogeneity of Illinois' isolated populations (Bluett *et al.* 2002). The recovery plan also advocates establishment of a long-term monitoring program and encourages use of silvicultural practices that promote regeneration of oak-hickory forests near sites occupied by woodrats (Bluett *et al.* 2002).

***Neotoma floridana*
(Eastern Woodrat)**

Ochrotomys nuttalli (Harlan)

GOLDEN MOUSE

MURIDAE

Status: Threatened in Illinois

Present Distribution: The golden mouse occurs throughout the southeastern quadrant of the United States from eastern Texas and Oklahoma east to the Atlantic coastal states from Virginia to Florida. Southern Illinois is at the northernmost edge of its range (Feldhamer and Paine 1987, Hoffmeister 1989). There are recent (since 1990) records of the golden mouse from Alexander, Gallatin, Hardin, Johnson, Pope, Saline, and Union counties, but this species also may be present in Jackson and Williamson counties.

Former Illinois Distribution: The present distribution of the golden mouse is probably similar to its former range in the state. There is one old report from Marion County near Salem (Cory 1912), but this record has been questioned by Hoffmeister (1989).

Habitat: In Illinois, the golden mouse inhabits dense thickets in a variety of wooded habitats including bottomland hardwood forests, pines, drainage-ways, abandoned upland fields, roadside rights-of-way and successional sites dominated by cedar (Andrews 1963, Blus 1966). This species appears to be dependent on the presence of a dense understory including honeysuckle, catbrier, and grape (Klimstra and Roseberry 1969, Feldhamer and Paine 1987, Hoffmeister 1989). Populations of golden mice are usually small and isolated with densities that range from 1-12 mice per ha (Andrews 1963).

Reason For Status: Golden mice occur primarily in the Shawnee Hills Natural Division within Illinois. Although recent surveys have documented a number of locations within the state, populations at these sites are generally small. The discontinuous distribution and specific habitat requirements qualify this species as a potentially threatened member of the Illinois fauna.

Management Recommendations: The current distribution and numbers of this species in Illinois should be closely monitored. Consideration should be given to appropriate habitat management where golden mice occur on public lands.

Ochrotomys nuttalli
(Golden Mouse)

Oryzomys palustris (Harlan)

RICE RAT

MURIDAE

Status: Threatened in Illinois

Present Distribution: The rice rat occurs from Texas, Oklahoma, and southeastern Kansas eastward to the Atlantic coast, and north to Pennsylvania and southern New Jersey (Hoffmeister 1989). Its range within Illinois extends from the Coastal Plain Division northward through the Shawnee Hills Section into the Mt. Vernon Hill Country.

Former Illinois Distribution: The present Illinois range of the rice rat is probably similar to its distribution of the last few centuries. Archeological evidence indicates that this species occurred farther north in the state during prehistoric times (Baker 1936, McLaughlin and Robertson 1951).

Habitat: Rice rats live in wet swampy fields and marshes of southern Illinois, especially in areas of the Shawnee Hills or Ozark Uplift (Hoffmeister 1989). In Illinois, they have been found along roadside ditches, farm ponds, marshy railroad rights-of-way, cypress swamps, marshes, and wet ecotonal areas of woods and grass (Klimstra and Roseberry 1969, McLaughlin and Robertson 1951, Klimstra and Scott 1956, Klimstra 1969, Hofmann et al. 1990, Hoffmeister 1989).

Reason For Status: The occurrence of this species in human-modified habitats is a favorable indication of its likelihood for continued existence in Illinois. However, due to the threatened nature of southern Illinois wetland habitats and the generally low population levels of this species a degree of concern is justified.

Management Recommendations: The major threat to this species is the continued loss of wetland habitat; therefore, existing populations in natural habitats such as cypress swamps and marshes should be protected.

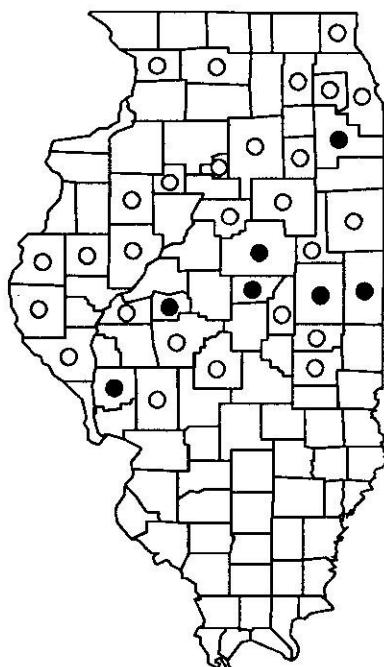

Oryzomys palustris
(Rice Rat)

Spermophilus franklinii (Sabine)

FRANKLIN'S GROUND SQUIRREL

SCIURIDAE

Status: Threatened in Illinois

Present Distribution: This species' range extends from east-central Alberta and southern Saskatchewan southeastward to parts of Nebraska, Missouri, Illinois and Indiana (Hall 1981, Hoffmeister 1989). Recent field surveys in Illinois (Hofmann 1998, Martin et al. 2003) verified the presence of Franklin's ground squirrels in Champaign and Vermilion counties; other occurrences were reported for Menard and DeWitt counties. Responses to a mail survey sent to wildlife biologists and staff at forest preserves, nature preserves, state parks and other public areas identified 11 extant colonies, mostly in the Chicago and Champaign areas, as well as 44 possible populations based on unconfirmed sightings along with the existence of historical records and/or the presence of suitable habitat; locations were scattered throughout much of the species' historical range in the state (Martin et al. 2002, 2003).

Former Illinois Distribution: Vouchered museum specimens have been collected from the northern two-thirds of Illinois (Hoffmeister 1989).

Habitat: Although this species' range overlaps the historical distribution of tallgrass prairie, colonies are often found along edges between grasslands and woodlands, forests, thickets, and wetlands (Cory 1912). Raised railroad beds flanked by dense grasses, forbs, shrubs, and occasional small trees provide cover and sites for burrowing, as do fence rows, old fields, roadsides, ditch banks, and unkept cemeteries with similar characteristics (Schwartz and Schwartz 1981, Hoffmeister 1989, Hofmann 1998).

Reason For Status: Lack of recent sightings, anecdotal opinions and a scarcity of contemporary museum specimens suggest this species may be declining in the eastern part of its range (Lewis and Rongstad 1992, Johnson and Choromanski-Norris 1992, Pergams and Nyberg 2001). Results of recent field surveys in Illinois must be considered preliminary, but difficulty locating colonies at sites where they occurred historically suggests that concern is warranted (Martin et al. 2002).

Management Recommendations: A rigorous assessment of the species' status is recommended. Efforts to establish populations in Cook and Knox counties (Panzer 1986, Van Petten and Schramm 1972) failed, indicating a need for basic ecological information (Martin et al. 2003) before introductions are attempted again. Establishing and maintaining grassland habitats are beneficial, especially where well-drained soils provide sites for excavating burrows for hibernation. Management regimes that include cool season grasses like brome and provide diverse stages of early- to mid- succession might be helpful.

Spermophilus franklinii
(Franklin's Ground Squirrel)

APPENDIX I

APPENDIX II. THE NATURAL DIVISIONS OF ILLINOIS

- 1** Wisconsin Driftless Division
- 2** Rock River Hill Country Division
 - a Freeport Section
 - b Oregon Section
- 3** Northeastern Morainal Division
 - a Morainal Section
 - b Lake Michigan Dunes Section
 - c Chicago Lake Plain Section
 - d Winnebago Drift Section
- 4** Grand Prairie Division
 - a Grand Prairie Section
 - b Springfield Section
 - c Western Section
 - d Green River Lowland Section
 - e Kankakee Sand Area Section
- 5** Upper Mississippi River and Illinois River Bottomlands Division
 - a Illinois River Section
 - b Mississippi River Section
- 6** Illinois River and Mississippi River Sand Areas Division
 - a Illinois River Section
 - b Mississippi River Section
- 7** Western Forest-Prairie Division
 - a Galesburg Section
 - b Carlinville Section
- 8** Middle Mississippi Border Division
 - a Glaciated Section
 - b Driftless Section
- 9** Southern Till Plain Division
 - a Effingham Plain Section
 - b Mt Vernon Hill Country Section
- 10** Wabash Border Division
 - a Bottomlands Section
 - b Southern Uplands Section
 - c Vermilion River Section
- 11** Ozark Division
 - a Northern Section
 - b Central Section
 - c Southern Section
- 12** Lower Mississippi River Bottomlands Division
 - a Northern Section
 - b Southern Section
- 13** Shawnee Hills Division
 - a Greater Shawnee Hills Section
 - b Lesser Shawnee Hills Section
- 14** Coastal Plain Division
 - a Cretaceous Hills Section
 - b Bottomlands Section

Schwegman, John E. principal author. 1973.
Comprehensive Plan for the Illinois Nature
Preserves System, Part 2. The Natural
Divisions of Illinois. Illinois Nature
Preserves Commission, Rockford. 32pp.

Appendix III- Taxonomic Listing of Endangered and Threatened Animal Species by Class and Family

Threatened species are designated with an asterisk (*), all other species are endangered.

GASTROPODA

DISCIDAE

Discus macclintocki

HYDROBIIDAE

Fontigens antroecetes

BIVALVIA

UNIONIDAE

*Alasmidonta viridis**

Cumberlandia monodonta

*Cyclonaias tuberculata**

Cyprogenia stegaria

*Ellipsaria lineolata**

*Elliptio crassidens**

*Elliptio dilatata**

Epioblasma triquetra

*Fusconaia ebena**

Lampsilis abrupta

Lampsilis fasciola

Lampsilis higginsii

*Ligumia recta**

Plethobasus cooperianus

Plethobasus cyphyus

Pleurobema clava

Pleurobema cordatum

Potamilus capax

Ptychobranchus fasciolaris

Quadrula cylindrica

Simpsonaias ambigua

Toxolasma lividus

Villosa iris

*Villosa lienosa**

MALACOSTRACA

ASELLIDAE

Caecidotea lesliei

Caecidotea spatulata

CRANGONYCTIDAE

Crangonyx anomalus

Crangonyx packardi

GAMMARIDAE

Gammarus acherondytes

Stygobromus iowae

CAMBARIDAE

Orconectes indianensis

Orconectes kentuckiensis

Orconectes lancifer

Orconectes placidus

INSECTA

LIBELLULIDAE

*Nannotheemis bella**

CORULIIDAE

Somatochlora hineana

CICADELLIDAE

*Aflexia rubranura**

Paraphlepsius lupalus

HESPERIIDAE

Atrytone arogos

*Hesperia metea**

*Hesperia ottoe**

RIODINIDAE

Calephelis muticum

NYMPHALIDAE

*Speyeria idalia**

LYCAENIDAE

Incisalia polios

Lycaeides melissa samuelis

NOCTUIDAE

Papaipema eryngii

AGNATHA

PETROMYZONTIDAE

Ichthyomyzon fossor

*Lampetra aepyptera**

OSTEICHTHYES

ACIPENSERIDAE

Acipenser fulvescens

Scaphirhynchus albus

SALMONIDAE

*Coregonus artedi**

CYPRINIDAE

*Erimystax x-punctatus**

Hybognathus hayi

Hybopsis amblops

Hybopsis amnis

Macrhybopsis gelida

Nocomis micropogon

Notropis anogenus

Notropis boops

*Notropis chalybaeus**

*Notropis heterodon**

Notropis heterolepis

Notropis maculatus

Notropis texanus

CATOSTOMIDAE

*Catostomus catostomus**

*Moxostoma carinatum**

Moxostoma valenciennesi

ICTALURIDAE

Noturus stigmosus

CYPRINODONTIDAE

*Fundulus diaphanus**

*Fundulus dispar**

CENTRARCHIDAE

*Lepomis miniatus**

*Lepomis symmetricus**

PERCIDAE

Ammocrypta clarum

*Ammocrypta pellucidum**

Etheostoma camurum

*Etheostoma exile**

Etheostoma histrio

AMPHIBIA

AMBYSTOMATIDAE

Ambystoma

*jeffersonianum**

Ambystoma platineum

PLETHODONTIDAE

Desmognathus conanti

Hemidactylium

*scutatum**

CRYPTOBRANCHIDAE

Cryptobranchus

alleganiensis
HYLIDAE
*Hyla avivoca**
*Pseudacris streckeri**
MICROHYLIDAE
Gastrophryne
*carolinensis**
REPTILIA
CHELYDRIDAE
Macrochelys temminckii
EMYDIDAE
Clemmys guttata
*Emydoidea blandingii**
Pseudemys concinna
KINOSTERNIDAE
Kinosternon flavescens
COLUBRIDAE
*Clonophis kirtlandi**
Elaphe emoryi
*Heterodon nasicus**
Masticophis flagellum
*Nerodia cyclopion**
Nerodia fasciata
*Tantilla gracilis**
*Thamnophis sauritus**
Tropidoclonion
*lineatum**
VIPERIDAE
*Crotalus horridus**
Sistrurus catenatus

AVES

PHASIANIDAE
Tympanuchus cupido
ARDEIDAE
Botaurus lentiginosus
*Ixobrychus exilis**
Egretta thula
Egretta caerulea
Nycticorax nycticorax
Nyctanassa violacea
ACCIPITRIDAE
Ictinia mississippiensis
Haliaeetus
*leucocephalus**
Circus cyaneus
Buteo swainsoni
Pandion haliaetus
FALCONIDAE
*Falco peregrinus**

RALLIDAE
Rallus elegans
Laterallus jamaicensis
*Gallinula chloropus**
GRUIDAE
*Grus canadensis**
CHARADRIIDAE
Charadrius melanotos
SCOLOPACIDAE
Bartramia longicauda
Phalaropus tricolor
LARIDAE
Sterna hirundo
Sterna forsteri
Sterna antillarum
Chlidonias niger
TYTONIDAE
Tyto alba
STRIGIDAE
Asio flammeus
LANIIDAE
*Lanius ludovicianus**
TROGLODYTIDAE
Thryomanes bewickii
PARULIDAE
*Dendroica cerulea**
Limnothlypis swainsonii
EMBERIZIDAE
*Ammodramus henslowii**
ICTERIDAE
Xanthocephalus
xanthocephalus

MAMMALIA

VESPERTILIONIDAE
Myotis sodalis
Myotis austroriparius
Myotis griseescens
Corynorhinus rafinesquii
CANIDAE
*Canis lupus**
SCIURIDAE
*Spermophilus franklinii**
MURIDAE
*Oryzomys palustris**
*Ochrotomys nuttalli**
Neotoma floridana

APPENDIX III - Cross Reference of Species to County -- County Listing

Counties with an asterisk (*) after them represent counties with recent (> 1994) records. Counties without an asterisk represent historic (< 1994) records.

Adams

Acipenser fulvescens
Ammodramus henslowii
Bartramia longicauda
Clonophis kirtlandi
Crotalus horridus
Cumberlandia monodonta
Cyclonaias tuberculata
Dendroica cerulea
*Ellipsaria lineolata**
Elliptio crassidens
Elliptio dilatata
Fusconia ebena
*Haliaeetus leucocephalus**
Ictinia mississippiensis
Lampsilis higginsi
Lanius ludovicianus
Laterallus jamaicensis
Ligumia recta
Machrochelys temminckii
*Myotis grisescens**
*Myotis sodalis**
Pandion haliaetus
Plethobasus cyphyus
Potamilus capax
Sistrurus catenatus
Spermophilis franklinii
Speyeria idalia
*Thryomanes bewickii**

Alexander

*Corynorhinus rafinesquii**
*Crotalus horridus**
Dendroica cerulea
Elliptio crassidens
Fusconia ebena
*Haliaeetus leucocephalus**
*Hybognathus hayi**
*Hyla avivoca**
Ictinia mississippiensis
Lanius ludovicianus
*Lepomis symmetricus**
Ligumia recta

Bureau

Limnothlypis swainsonii
*Myotis austroriparius**
Myotis grisescens
*Myotis sodalis**
Neotoma floridana
Nerodia cyclopion
Nerodia fasciata
*Notropis boops**
*Ochrotomys nuttalli**
*Orconectes lancifer**
*Oryzomys palustris**
Plethobasus cyphyus
Pleurobema cordatum
Potamilus capax
*Pseudacris streckeri**
Pseudemys concinna
*Sterna antillarum**

Bond

Bartramia longicauda
Crotalus horridus
Elliptio dilatata
*Lanius ludovicianus**
*Myotis sodalis**
Nycticorax nycticorax

Boone

Alasmidonta viridis
*Ammodramus henslowii**
Buteo swainsoni
Elliptio dilatata
Etheostoma exile
Lanius ludovicianus
Notropis heterolepis
Pandion haliaetus

Brown

*Ammodramus henslowii**
*Botaurus lentiginosus**
Fusconia ebena
*Thryomanes bewickii**

Bureau

Cyclonaias tuberculata
Ellipsaria lineolata
Elliptio dilatata
*Emydoidea blandingii**

Helpful Contacts Regarding Endangered and Threatened Species In Illinois

Illinois Department of Natural Resources

Division of Natural Heritage: identification, protection, management, and recovery of nongame and endangered species, natural areas, nature preserves 217/785-8774.

Endangered and Threatened Species Conservation Program: management and recovery of endangered species 217/785-8774.

Division of Resource Review and Coordination: endangered species consultation (impact assessments) 217/785-5500.

Natural Heritage Database: computerized database of natural areas, endangered species, and other significant features in Illinois 217/785-8774.

Natural Areas Program: identification, acquisition, or management of natural areas 217/785-8774.

Illinois Endangered Species Protection Board

Status and distribution of endangered and threatened species, listing of species as endangered or threatened 217/785-8687.

Illinois Nature Preserves Commission

Protection and Dedication of State Nature Preserves 217/785-8686.

Equal opportunity to participate in programs of the Illinois Department of Natural Resources (IDNR), Illinois Endangered Species Protection Board, and those funded by the U.S. Fish and Wildlife Service and other agencies is available to all individuals regardless of race, sex, national origin, disability, age, religion, or other non-merit factors. If you believe you have been discriminated against, contact the funding source's civil rights office and/or the Equal Employment Opportunity Officer, IDNR, One Natural Resources Way, Springfield, IL 62702-1271; 217/782-1274.

Information is available to the hearing impaired by calling the Illinois Department of Natural Resources Telecommunications Device for the Deaf [TDD] at 217/782-9175.

Printed by the Authority of the State of Illinois, 11/06, 3M
